Preface

About This Guide

This guide describes routing protocols including multicast, RIP, OSPF, IS-IS, BGP, and route policies provided by the 7750 SR OS and presents configuration and implementation examples.

This document is organized into functional chapters and provides concepts and descriptions of the implementation flow, as well as Command Line Interface (CLI) syntax and command usage.

Audience

This manual is intended for network administrators who are responsible for configuring the 7750 SR-Series routers. It is assumed that the network administrators have an understanding of networking principles and configurations. Protocols, standards, and services described in this manual include the following:

- Multicast IGMP and PIM-SM
- Routing Reservation Protocol (RIP)
- Open Shortest Path First (OSPF)
- Intermediate System to Intermediate System (IS-IS)
- Border Gateway Protocol (BGP)
- Route policies

List of Technical Publications

The 7750 SR documentation set is composed of the following books:

• 7750 SR OS Basic System Configuration Guide

This guide describes basic system configurations and operations.

• 7750 SR OS System Management Guide

This guide describes system security and access configurations as well as event logging and accounting logs.

• 7750 SR OS Interface Configuration Guide

This guide describes card, Media Dependent Adapter (MDA), and port provisioning.

• 7750 SR OS Router Configuration Guide

This guide describes logical IP routing interfaces and associated attributes such as an IP address, port, link aggregation group (LAG) as well as IP and MAC-based filtering, VRRP, and Cflowd.

• 7750 SR OS Routing Protocols Guide

This guide provides an overview of routing concepts and provides configuration examples for RIP, OSPF, IS-IS, Multicast, BGP, and route policies.

7750 SR OS MPLS Guide

This guide describes how to configure Multiprotocol Label Switching (MPLS) and Label Distribution Protocol (LDP).

7750 SR OS Services Guide

This guide describes how to configure service parameters such as service distribution points (SDPs), customer information, and user services.

• 7750 SR OS OAM and Diagnostic Guide

This guide describes how to configure features such as service mirroring and Operations, Administration and Management (OAM) tools.

7750 SR OS Triple Play Guide

This guide describes Triple Play services and support provided by the 7750 SR 7450 ESS 7710 SR and presents examples to configure and implement various protocols and services.

• 7750 SR OS Quality of Service Guide

This guide describes how to configure Quality of Service (QoS) policy management.

OS Multi-Service ISA Guide

This guide describes services provided by integrated service adapters such as Application Assurance, IPSec, ad insertion (ADI) and Network Address Translation (NAT).

Technical Support

If you purchased a service agreement for your 7750 SR-Series router and related products from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller for assistance. If you purchased an Alcatel-Lucent service agreement, contact your welcome center at:

Web: http://www1.alcatel-lucent.com/comps/pages/carrier_support.jhtml

Getting Started

In This Chapter

This chapter provides process flow information to configure IP routing protocols.

Alcatel-Lucent 7750 SR-Series Router Configuration Process

Table 1 lists the tasks necessary to configure RIP, OSPF, and IS-IS, BGP, and multicast protocols, and route policies. This guide is presented in an overall logical configuration flow. Each section describes a software area and provides CLI syntax and command usage to configure parameters for a functional area.

Table 1: Configuration Process

Area	Task	Chapter
Protocol configuration	Configure routing protocols:	
	 Multicast 	Multicast on page 21
	• RIP	RIP on page 227
	• OSPF	OSPF on page 281
	• IS-IS	IS-IS on page 415
	• BGP	BGP on page 519
Policy configuration	 Configure route policies 	Route Policies on page 657
Reference	List of IEEE, IETF, and other proprietary entities.	Standards and Protocol Support on page 735

Multicast

In This Chapter

This chapter provides information about IPv6, Internet Group Management Protocol (IGMP) and Protocol Independent Multicast (PIM).

Topics in this chapter include:

- Introduction to Multicast on page 22
 - → Multicast Models on page 23
- IPv6 Multicast on page 25
- Core Router Multicast Requirements on page 27
 - → Internet Group Management Protocol on page 27
 - → Source-Specific Multicast Groups on page 29
 - → Protocol Independent Multicast Sparse Mode (PIM-SM) on page 30
 - → Anycast RP for PIM-SM on page 36
 - → PIM SSM on page 25
 - → Multicast Listener Discovery (MLD v1 and v2) on page 25
 - → Multicast Extensions to MBGP on page 39
 - → Multicast Source Discovery Protocol (MSDP) on page 40
 - → Multicast Connection Admission Control (MCAC) on page 48
- Multicast Configuration Process Overview on page 56
- Configuration Notes on page 57

Introduction to Multicast

IP multicast provides an effective method of many-to-many communication. Delivering unicast datagrams is fairly simple. Normally, IP packets are sent from a single source to a single recipient. The source inserts the address of the target host in the IP header destination field of an IP datagram, intermediate routers (if present) simply forward the datagram towards the target in accordance with their respective routing tables.

Sometimes distribution needs individual IP packets be delivered to multiple destinations (like audio or video streaming broadcasts). Multicast is a method of distributing datagrams sourced from one (or possibly more) host(s) to a set of receivers that may be distributed over different (sub) networks. This makes delivery of multicast datagrams significantly more complex.

Multicast sources can send a single copy of data using a single address for the entire group of recipients. The routers between the source and recipients route the data using the group address route. Multicast packets are delivered to a multicast group. A multicast group specifies a set of recipients who are interested in a particular data stream and is represented by an IP address from a specified range. Data addressed to the IP address is forwarded to the members of the group. A source host sends data to a multicast group by specifying the multicast group address in the datagram's destination IP address. A source does not have to register in order to send data to a group nor do they need to be a member of the group.

Routers and Layer 3 switches use the Internet Group Management Protocol (IGMP) to manage membership for a multicast session. When a host wants to receive one or more multicast sessions it will send a join message for each multicast group it wants to join. When a host wants to leave a multicast group, it will send a leave message.

To extend multicast to the Internet, the multicast backbone (Mbone) is used. The Mbone is layered on top of portions of the Internet. These portions, or islands, are interconnected using tunnels. The tunnels allow multicast traffic to pass between the multicast-capable portions of the Internet. As more and more routers in the Internet are multicast-capable (and scalable) the unicast and multicast routing table will converge.

The original Mbone was based on Distance Vector Multicast Routing Protocol (DVMRP) and was very limited. The Mbone is, however, converging around the following protocol set:

- IGMP
- Protocol Independent Multicast (Sparse Mode) (PIM-SM)
- Border Gateway Protocol with multi-protocol extensions (MBGP)
- Multicast Source Discovery Protocol (MSDP)

Multicast Models

Alcatel-Lucent 7750 SRs support two models to provide multicast:

- Any-Source Multicast (ASM) on page 23
- Source Specific Multicast (SSM) on page 23

Any-Source Multicast (ASM)

Any-Source Multicast (ASM) is the IP multicast service model defined in RFC 1112, *Host extensions for IP Multicasting*. An IP datagram is transmitted to a host group, a set of zero or more end-hosts identified by a single IP destination address (224.0.0.0 through 239.255.255.255 for IPv4). End-hosts can join and leave the group any time and there is no restriction on their location or number. This model supports multicast groups with arbitrarily many senders. Any end-host can transmit to a host group even if it is not a member of that group.

To combat the vast complexity and scaling issues that ASM represents, the IETF is developing a service model called Source Specific Multicast (SSM).

Source Specific Multicast (SSM)

The Source Specific Multicast (SSM) service model defines a channel identified by an (S,G) pair, where S is a source address and G is an SSM destination address. In contrast to the ASM model, SSM only provides network-layer support for one-to-many delivery.

The SSM service model attempts to alleviate the following deployment problems that ASM has presented:

- Address allocation SSM defines channels on a per-source basis. For example, the channel (S1,G) is distinct from the channel (S2,G), where S1 and S2 are source addresses, and G is an SSM destination address. This averts the problem of global allocation of SSM destination addresses and makes each source independently responsible for resolving address collisions for the various channels it creates.
- Access control SSM provides an efficient solution to the access control problem. When a receiver subscribes to an (S,G) channel, it receives data sent only by the source S. In contrast, any host can transmit to an ASM host group. At the same time, when a sender picks a channel (S,G) to transmit on, it is automatically ensured that no other sender will be transmitting on the same channel (except in the case of malicious acts such as address spoofing). This makes it harder to spam an SSM channel than an ASM multicast group.
- Handling of well-known sources SSM requires only source-based forwarding trees.
 This eliminates the need for a shared tree infrastructure. In terms of the IGMP, PIM-SM,

Introduction to Multicast

MSDP, MBGP protocol suite, this implies that neither the RP-based shared tree infrastructure of PIM-SM nor the MSDP protocol is required. Thus, the complexity of the multicast routing infrastructure for SSM is low, making it viable for immediate deployment. Note that MBGP is still required for distribution of multicast reachability information.

• Anticipating that point-to-multipoint applications such as Internet TV will be significant in the future, the SSM model is better suited for such applications.

IPv6 Multicast

IPv6 multicast enables multicast applications over native IPv6 networks. There are two service models: Any Source Multicast (ASM) and Source Specific Multicast (SSM) which includes PIM SSM and MLD (v1 and v2). SSM does not require source discovery and only supports single source for a specific multicast stream. As a result, SSM is easier to operate in a large scale deployment that uses the one-to-many service model.

Multicast Listener Discovery (MLD v1 and v2)

MLD is the IPv6 version of IGMP. The purpose of MLD is to allow each IPv6 router to discover the presence of multicast listeners on its directly attached links, and to discover specifically which multicast groups are of interest to those neighboring nodes.

MLD is a sub-protocol of ICMPv6. MLD message types are a subset of the set of ICMPv6 messages, and MLD messages are identified in IPv6 packets by a preceding Next Header value of 58. All MLD messages are sent with a link-local IPv6 source address, a Hop Limit of 1, and an IPv6 Router Alert option in the Hop-by-Hop Options header.

Similar to IGMPv2, MLDv1 reports only include the multicast group addresses that listeners are interested in, and don't include the source addresses. In order to work with PIM SSM model, a similar SSM translation function is required when MLDv1 is used.

SSM translation allows an IGMPv2 device to join an SSM multicast network through the router that provides such a translation capability. Currently SSM translation can done at a box level, but this does not allow a per-interface translation to be specified. SSM translation per interface offers the ability to have a same (*,G) mapped to two different (S,G) on two different interfaces to provide flexibility.

MLDv2 is backward compatible with MLDv1 and adds the ability for a node to report interest in listening to packets with a particular multicast group only from specific source addresses or from all sources except for specific source addresses.

PIM SSM

The IPv6 address family for SSM model is supported. This includes the ability to choose which RTM table to use (unicast RTM, multicast RTM, or both). OSPF3, IS-IS and static-route have extensions to support submission of routes into the IPv6 multicast RTM.

IPv6 PIM ASM

IPv6 PIM ASM is supported. All PIM ASM related functions such as bootstrap router, RP, etc., support both IPv4 and IPv6 address-families. IPv6 specific parameters are configured under **configure>router>pim>rp>ipv6**.

Embedded RP

The detailed protocol specification is defined in RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*. This RFC describes a multicast address allocation policy in which the address of the RP is encoded in the IPv6 multicast group address, and specifies a PIM-SM group-to-RP mapping to use the encoding, leveraging, and extending unicast-prefix-based addressing. This mechanism not only provides a simple solution for IPv6 inter-domain ASM but can be used as a simple solution for IPv6 intra-domain ASM with scoped multicast addresses as well. It can also be used as an automatic RP discovery mechanism in those deployment scenarios that would have previously used the Bootstrap Router protocol (BSR).

Core Router Multicast Requirements

This section describes the multicast requirements when an Alcatel-Lucent 7750 SR is deployed as part of the user's core network.

The required protocol set is as follows:

- Internet Group Management Protocol (Internet Group Management Protocol on page 27)
- Source Specific Multicast Groups (SSM on page 29)
- Protocol Independent Multicast (Sparse Mode) (PIM-SM on page 30)
- Multicast Extensions to MBGP (Multicast Extensions to MBGP on page 39)

Internet Group Management Protocol

Internet Group Management Protocol (IGMP) is used by IPv4 hosts and routers to report their IP multicast group memberships to neighboring multicast routers. A multicast router keeps a list of multicast group memberships for each attached network, and a timer for each membership.

Multicast group memberships include at least one member of a multicast group on a given attached network, not a list of all of the members. With respect to each of its attached networks, a multicast router can assume one of two roles, querier or non-querier. There is normally only one querier per physical network.

A querier issues two types of queries, a general query and a group-specific query. General queries are issued to solicit membership information with regard to any multicast group. Group-specific queries are issued when a router receives a leave message from the node it perceives as the last group member remaining on that network segment.

Hosts wanting to receive a multicast session issue a multicast group membership report. These reports must be sent to all multicast enabled routers.

IGMP Versions and Interoperability Requirements

If routers run different versions of IGMP, they will negotiate the lowest common version of IGMP that is supported on their subnet and operate in that version.

Version 1 — Specified in RFC-1112, *Host extensions for IP Multicasting*, was the first widely deployed version and the first version to become an Internet standard.

Version 2 — Specified in RFC-2236, *Internet Group Management Protocol*, added support for "low leave latency", that is, a reduction in the time it takes for a multicast router to learn that there are no longer any members of a particular group present on an attached network.

Version 3 — Specified in RFC-3376, *Internet Group Management Protocol*, adds support for source filtering, that is, the ability for a system to report interest in receiving packets only from specific source addresses, as required to support Source-Specific Multicast (See Source Specific Multicast (SSM)), or from all but specific source addresses, sent to a particular multicast address.

IGMPv3 must keep state per group per attached network. This group state consists of a filter-mode, a list of sources, and various timers. For each attached network running IGMP, a multicast router records the desired reception state for that network.

IGMP Version Transition

Alcatel-Lucent's 7750 SR routers are capable of interoperating with routers and hosts running IGMPv1, IGMPv2, and/or IGMPv3. *Draft-ietf-magma-igmpv3-and-routing-0x.txt* explores some of the interoperability issues and how they affect the various routing protocols.

IGMP version 3 specifies that if at any point a router receives an older version query message on an interface that it must immediately switch into a compatibility mode with that earlier version. Since none of the previous versions of IGMP are source aware, should this occur and the interface switch to Version 1 or 2 compatibility mode, any previously learned group memberships with specific sources (learned via the IGMPv3 specific INCLUDE or EXCLUDE mechanisms) MUST be converted to non-source specific group memberships. The routing protocol will then treat this as if there is no EXCLUDE definition present.

Source-Specific Multicast Groups

IGMPv3 permits a receiver to join a group and specify that it only wants to receive traffic for a group if that traffic comes from a particular source. If a receiver does this, and no other receiver on the LAN requires all the traffic for the group, then the designated router (DR) can omit performing a (*,G) join to set up the shared tree, and instead issue a source-specific (S,G) join only.

The range of multicast addresses from 232.0.0.0 to 232.255.255.255 is currently set aside for source-specific multicast in IPv4. For groups in this range, receivers should only issue source-specific IGMPv3 joins. If a PIM router receives a non-source-specific join for a group in this range, it should ignore it.

An Alcatel-Lucent 7750 SR PIM router must silently ignore a received (*,G) PIM join message where G is a multicast group address from the multicast address group range that has been explicitly configured for SSM. This occurrence should generate an event. If configured, the IGMPv2 request can be translated into IGMPv3. The 7750 allows for the conversion of an IGMPv2 (*,G) request into a IGMPv3 (S,G) request based on manual entries. A maximum of 32 SSM ranges is supported.

IGMPv3 also permits a receiver to join a group and specify that it only wants to receive traffic for a group if that traffic does not come from a specific source or sources. In this case, the DR will perform a (*,G) join as normal, but can combine this with a prune for each of the sources the receiver does not wish to receive.

Protocol Independent Multicast Sparse Mode (PIM-SM)

PIM-SM leverages the unicast routing protocols that are used to create the unicast routing table, OSPF, IS-IS, BGP, and static routes. Because PIM uses this unicast routing information to perform the multicast forwarding function it is effectively IP protocol independent. Unlike DVMRP, PIM does not send multicast routing tables updates to its neighbors.

PIM-SM uses the unicast routing table to perform the Reverse Path Forwarding (RPF) check function instead of building up a completely independent multicast routing table.

PIM-SM only forwards data to network segments with active receivers that have explicitly requested the multicast group. PIM-SM in the ASM model initially uses a shared tree to distribute information about active sources. Depending on the configuration options, the traffic can remain on the shared tree or switch over to an optimized source distribution tree. As multicast traffic starts to flow down the shared tree, routers along the path determine if there is a better path to the source. If a more direct path exists, then the router closest to the receiver sends a join message toward the source and then reroutes the traffic along this path.

As stated above, PIM-SM relies on an underlying topology-gathering protocol to populate a routing table with routes. This routing table is called the Multicast Routing Information Base (MRIB). The routes in this table can be taken directly from the unicast routing table, or it can be different and provided by a separate routing protocol such as MBGP. Regardless of how it is created, the primary role of the MRIB in the PIM-SM protocol is to provide the next hop router along a multicast-capable path to each destination subnet. The MRIB is used to determine the next hop neighbor to whom any PIM join/prune message is sent. Data flows along the reverse path of the join messages. Thus, in contrast to the unicast RIB that specifies the next hop that a data packet would take to get to some subnet, the MRIB gives reverse-path information, and indicates the path that a multicast data packet would take from its origin subnet to the router that has the MRIB.

PIM-SM Functions

PIM-SM functions in three phases:

- Phase One on page 31
- Phase Two on page 31
- Phase Three on page 32

Phase One

In this phase, a multicast receiver expresses its interest in receiving traffic destined for a multicast group. Typically it does this using IGMP or MLD, but other mechanisms might also serve this purpose. One of the receiver's local routers is elected as the DR for that subnet. When the expression of interest is received, the DR sends a PIM join message towards the RP for that multicast group. This join message is known as a (*,G) join because it joins group G for all sources to that group. The (*,G) join travels hop-by-hop towards the RP for the group, and in each router it passes through the multicast tree state for group G is instantiated. Eventually the (*,G) join either reaches the RP or reaches a router that already has (*,G) join state for that group. When many receivers join the group, their join messages converge on the RP and form a distribution tree for group G that is rooted at the RP. This is known as the RP tree and is also known as the shared tree because it is shared by all sources sending to that group. Join messages are resent periodically as long as the receiver remains in the group. When all receivers on a leaf-network leave the group, the DR will send a PIM (*,G) prune message towards the RP for that multicast group. However if the prune message is not sent for any reason, the state will eventually time out.

A multicast data sender starts sending data destined for a multicast group. The sender's local router (the DR) takes those data packets, unicast-encapsulates them, and sends them directly to the RP. The RP receives these encapsulated data packets, de-encapsulates them, and forwards them onto the shared tree. The packets then follow the (*,G) multicast tree state in the routers on the RP tree, being replicated wherever the RP tree branches, and eventually reaching all the receivers for that multicast group. The process of encapsulating data packets to the RP is called registering, and the encapsulation packets are known as PIM register packets.

At the end of phase one, multicast traffic is flowing encapsulated to the RP, and then natively over the RP tree to the multicast receivers.

Phase Two

In this phase, register-encapsulation of data packets is performed. However, register-encapsulation of data packets is unsuitable for the following reasons:

- Encapsulation and de-encapsulation can be resource intensive operations for a router to perform depending on whether or not the router has appropriate hardware for the tasks.
- Traveling to the RP and then back down the shared tree can cause the packets to travel a
 relatively long distance to reach receivers that are close to the sender. For some
 applications, increased latency is unwanted.

Although register-encapsulation can continue indefinitely, for these reasons, the RP will normally switch to native forwarding. To do this, when the RP receives a register-encapsulated data packet from source S on group G, it will normally initiate an (S,G) source-specific join towards S. This join message travels hop-by-hop towards S, instantiating (S,G) multicast tree state in the routers along the path. (S,G) multicast tree state is used only to forward packets for group G if those

packets come from source S. Eventually the join message reaches S's subnet or a router that already has (S,G) multicast tree state, and then packets from S start to flow following the (S,G) tree state towards the RP. These data packets can also reach routers with (*,G) state along the path towards the RP - if so, they can short-cut onto the RP tree at this point.

While the RP is in the process of joining the source-specific tree for S, the data packets will continue being encapsulated to the RP. When packets from S also start to arrive natively at the RP, the RP will be receiving two copies of each of these packets. At this point, the RP starts to discard the encapsulated copy of these packets and it sends a register-stop message back to S's DR to prevent the DR unnecessarily encapsulating the packets. At the end of phase 2, traffic will be flowing natively from S along a source-specific tree to the RP and from there along the shared tree to the receivers. Where the two trees intersect, traffic can transfer from the shared RP tree to the shorter source tree.

Note that a sender can start sending before or after a receiver joins the group, and thus, phase two may occur before the shared tree to the receiver is built.

Phase Three

In this phase, the RP joins back towards the source using the shortest path tree. Although having the RP join back towards the source removes the encapsulation overhead, it does not completely optimize the forwarding paths. For many receivers the route via the RP can involve a significant detour when compared with the shortest path from the source to the receiver.

To obtain lower latencies, a router on the receiver's LAN, typically the DR, may optionally initiate a transfer from the shared tree to a source-specific shortest-path tree (SPT). To do this, it issues an (S,G) Join towards S. This instantiates state in the routers along the path to S. Eventually this join either reaches S's subnet or reaches a router that already has (S,G) state. When this happens, data packets from S start to flow following the (S,G) state until they reach the receiver.

At this point the receiver (or a router upstream of the receiver) will be receiving two copies of the data - one from the SPT and one from the RPT. When the first traffic starts to arrive from the SPT, the DR or upstream router starts to drop the packets for G from S that arrive via the RP tree. In addition, it sends an (S,G) prune message towards the RP. The prune message travels hop-by-hop instantiating state along the path towards the RP indicating that traffic from S for G should NOT be forwarded in this direction. The prune message is propagated until it reaches the RP or a router that still needs the traffic from S for other receivers.

By now, the receiver will be receiving traffic from S along the shortest-path tree between the receiver and S. In addition, the RP is receiving the traffic from S, but this traffic is no longer reaching the receiver along the RP tree. As far as the receiver is concerned, this is the final distribution tree.

Encapsulating Data Packets in the Register Tunnel

Conceptually, the register tunnel is an interface with a smaller MTU than the underlying IP interface towards the RP. IP fragmentation on packets forwarded on the register tunnel is performed based upon this smaller MTU. The encapsulating DR can perform path-MTU discovery to the RP to determine the effective MTU of the tunnel. This smaller MTU takes both the outer IP header and the PIM register header overhead into consideration.

PIM Bootstrap Router Mechanism

For proper operation, every PIM-SM router within a PIM domain must be able to map a particular global-scope multicast group address to the same RP. If this is not possible, then black holes can appear (this is where some receivers in the domain cannot receive some groups). A domain in this context is a contiguous set of routers that all implement PIM and are configured to operate within a common boundary.

The bootstrap router (BSR) mechanism provides a way in which viable group-to-RP mappings can be created and distributed to all the PIM-SM routers in a domain. Each candidate BSR originates bootstrap messages (BSMs). Every BSM contains a BSR priority field. Routers within the domain flood the BSMs throughout the domain. A candidate BSR that hears about a higher-priority candidate BSR suppresses its sending of further BSMs for a period of time. The single remaining candidate BSR becomes the elected BSR and its BSMs inform the other routers in the domain that it is the elected BSR.

It is adaptive, meaning that if an RP becomes unreachable, it will be detected and the mapping tables will be modified so the unreachable RP is no longer used and the new tables will be rapidly distributed throughout the domain.

PIM-SM Routing Policies

Multicast traffic can be restricted from certain source addresses by creating routing policies. Join messages can be filtered using import filters. PIM join policies can be used to reduce denial of service attacks and subsequent PIM state explosion in the router and to remove unwanted multicast streams at the edge of the network before it is carried across the core. Route policies are created in the **config>router>policy-options** context. See Configuring PIM Join/Register Policies on page 692.

Join and register route policy match criteria for PIM-SM can specify the following:

- Router interface or interfaces specified by name or IP address.
- Neighbor address (the source address in the IP header of the join and prune message).
- Multicast group address embedded in the join and prune message.

Multicast source address embedded in the join and prune message.

Join policies can be used to filter PIM join messages so no *,G or S,G state will be created on the router.

Table 2: Join Filter Policy Match Conditions

Motob Condition

Match Condition	matches the:
Interface	RTR interface by name
Neighbor	The neighbors source address in the IP header
Group Address	Multicast Group address in the join/prune message
Source Address	Source address in the join/prune message

Matakaa tha

PIM register message are sent by the first hop designated router that has a direct connection to the source. This serves a dual purpose:

- Notifies the RP that a source has active data for the group
- Delivers the multicast stream in register encapsulation to the RP and its potential receivers.
- If no one has joined the group at the RP, the RP will ignore the registers.

In an environment where the sources to particular multicast groups are always known, it is possible to apply register filters at the RP to prevent any unwanted sources from transmitting multicast stream. You can apply these filters at the edge so that register data does not travel unnecessarily over the network towards the RP.

Table 3: Register Filter Policy Match Conditions

Match Condition	Matches the:
Interface	RTR interface by name
Group Address	Multicast Group address in the join/prune message
Source Address	Source address in the join/prune message

Reverse Path Forwarding Checks

Multicast implements a reverse path forwarding check (RPF). RPF checks the path that multicast packets take between their sources and the destinations to prevent loops. Multicast requires that an incoming interface is the outgoing interface used by unicast routing to reach the source of the multicast packet. RPF forwards a multicast packet only if it is received on an interface that is used by the router to route to the source.

If the forwarding paths are modified due to routing topology changes then any dynamic filters that may have been applied must be re-evaluated. If filters are removed then the associated alarms are also cleared.

Anycast RP for PIM-SM

The implementation of Anycast RP for PIM-SM environments enable fast convergence when a PIM rendezvous point (RP) router fails by allowing receivers and sources to rendezvous at the closest RP. It allows an arbitrary number of RPs per group in a single shared-tree protocol Independent Multicast-Sparse Mode (PIM-SM) domain. This is, in particular, important for triple play configurations that opt to distribute multicast traffic using PIM-SM, not SSM. In this case, RP convergence must be fast enough to avoid the loss of multicast streams which could cause loss of TV delivery to the end customer.

Anycast RP for PIM-SM environments is supported in the base routing/PIM-SM instance of the service router. In the 7710 SR and 7750 SR product lines, this feature is supported in Layer 3-VPRN instances that are configured with PIM.

Implementation

The Anycast RP for PIM-SM implementation is defined in *draft-ietf-pim-anycast-rp-03*, *Anycast-RP using PIM*, and is similar to that described in RFC 3446, *Anycast RP Mechanism Using PIM and MSDP*, and extends the register mechanism in PIM so Anycast RP functionality can be retained without using Multicast Source Discovery Protocol (MSDP) (see on page 40).

The mechanism works as follows:

- An IP address is chosen to use as the RP address. This address is statically configured, or distributed using a dynamic protocol, to all PIM routers throughout the domain.
- A set of routers in the domain are chosen to act as RPs for this RP address. These routers are called the Anycast-RP set.
- Each router in the Anycast-RP set is configured with a loopback interface using the RP address.
- Each router in the Anycast-RP set also needs a separate IP address to be used for communication between the RPs.
- The RP address, or a prefix that covers the RP address, is injected into the unicast routing system inside of the domain.
- Each router in the Anycast-RP set is configured with the addresses of all other routers in the Anycast-RP set. This must be consistently configured in all RPs in the set.

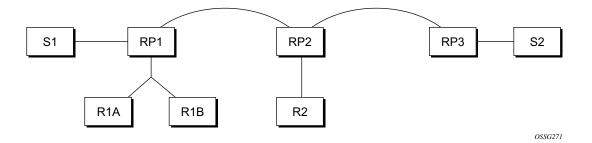

Figure 1: Anycast RP for PIM-SM Implementation Example

Assume the scenario in Figure 1 is completely connected where R1A, R1B, and R2 are receivers for a group, and S1 and S2 send to that group. Assume RP1, RP2, and RP3 are all assigned the same IP address which is used as the Anycast-RP address (for example, the IP address is RPA).

Note, the address used for the RP address in the domain (the Anycast-RP address) must be different than the addresses used by the Anycast-RP routers to communicate with each other.

The following procedure is used when S1 starts sourcing traffic:

- S1 sends a multicast packet.
- The DR directly attached to S1 will form a PIM register message to send to the Anycast-RP address (RPA). The unicast routing system will deliver the PIM register message to the nearest RP, in this case RP1A.
- RP1 will receive the PIM register message, de-encapsulate it, send the packet down the shared-tree to get the packet to receivers R1A and R1B.
- RP1 is configured with RP2 and RP3's IP address. Since the register message did not come from one of the RPs in the anycast-RP set, RP1 assumes the packet came from a DR. If the register message is not addressed to the Anycast-RP address, an error has occurred and it should be rate-limited logged.
- RP1 will then send a copy of the register message from S1's DR to both RP2 and RP3. RP1 will use its own IP address as the source address for the PIM register message.
- RP1 may join back to the source-tree by triggering a (S1,G) Join message toward S1. However, RP1 must create (S1,G) state.
- RP2 receives the register message from RP1, de-encapsulates it, and also sends the packet down the shared-tree to get the packet to receiver R2.
- RP2 sends a register-stop message back to the RP1. RP2 may wait to send the register-stop message if it decides to join the source-tree. RP2 should wait until it has received data from the source on the source-tree before sending the register-stop message. If RP2

Core Router Multicast Requirements

- decides to wait, the register-stop message will be sent when the next register is received. If RP2 decides not to wait, the register-stop message is sent now.
- RP2 may join back to the source-tree by triggering a (S1,G) Join message toward S1. However, RP2 must create (S1,G) state.
- RP3 receives the register message from RP1, de-encapsulates it, but since there are no receivers joined for the group, it can discard the packet.
- RP3 sends a register-stop message back to the RP1.
- RP3 creates (S1,G) state so when a receiver joins after S1 starts sending, RP3 can join quickly to the source-tree for S1.
- RP1 processes the register-stop message from each of RP2 and RP3. RP1 may cache on a per-RP/per-(S,G) basis the receipt of register-stop message messages from the RPs in the anycast-RP set. This option is performed to increase the reliability of register message delivery to each RP. When this option is used, subsequent register messages received by RP1 are sent only to the RPs in the Anycast-RP set which have not previously sent register-stop message messages for the (S,G) entry.
- RP1 sends a register-stop message back to the DR the next time a register message is received from the DR and (when the option in the last bullet is in use) if all RPs in the Anycast-RP set have returned register-stop messages for a particular (S,G) route.

The procedure for S2 sending follows the same as above but it is RP3 which sends a copy of the register originated by S2's DR to RP1 and RP2. Therefore, this example shows how sources anywhere in the domain, associated with different RPs, can reach all receivers, also associated with different RPs, in the same domain.

Multicast Extensions to MBGP

This section describes the implementation of extensions to MBGP to support multicast. Rather than assuming that all unicast routes are multicast-capable, some routed environments, in some cases, some ISPs do not support or have limited support for multicast throughout their AS.

BGP is capable of supporting two sets of routing information, one set for unicast routing and the other for multicast routing. The unicast and multicast routing sets either partially or fully overlay one another. To achieve this, BGP has added support for IPv4 and mcast-IPv4 address families. Routing policies can be imported or exported.

The multicast routing information can subsequently be used by the Protocol Independent Multicast (PIM) protocol to perform its Reverse Path Forwarding (RPF) lookups for multicast-capable sources. Thus, multicast traffic can only be routed across a multicast topology and not a unicast topology.

MBGP Multicast Topology Support

Recursive Lookup for BGP Next Hops

The next hop for multicast RPF routes learned by MBGP is not always the address of a directly-connected neighbor. For unicast routing, a router resolves the directly-connected next-hop by repeating the IGP routes. For multicast RPF routes, there are different ways to find the real next-hops.

- Scanning to see if a route encompasses the BGP next hop. If one exists, this route is used. If not, the tables are scanned for the best matching route.
- Check to see if the recursed next hop is taken from the protocol routing table with the lowest administrative distance (protocol preference). This means that the operating system algorithm must preform multiple lookups in the order of the lowest admin distance. Note that unlike recursion on the unicast routing table, the longest prefix match rule does not take effect; protocol preference is considered prior to prefix length. For example, the route 12.0.0.0/14 learned via MBGP will be selected over the route 12.0.0.0/16 learned via BGP.

Multicast Source Discovery Protocol (MSDP)

MSDP-speaking routers in a PIM-SM (RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification*) domain have MSDP peering relationship with MSDP peers in another domain. The peering relationship is made up of a TCP connection in which control information is exchanged. Each domain has one or more connections to this virtual topology.

When a PIM-SM RP learns about a new multicast source within its own domain from a standard PIM register mechanism, it encapsulates the first data packet in an MSDP source-active message and sends it to all MSDP peers.

The source-active message is flooded (after an RPF check) by each peer to its MSDP peers until the source-active message reaches every MSDP router in the interconnected networks. If the receiving MSDP peer is an RP, and the RP has a (*.G) entry (receiver) for the group, the RP creates state for the source and joins to the shortest path tree for the source. The encapsulated data is deencapsulated and forwarded down the shared tree of that RP. When the packet is received by the last hop router of the receiver, the last hop router also may join the shortest path tree to the source.

The MSDP speaker periodically sends source-active messages that include all sources.

Anycast RP for MSDP

MSDP is a mechanism that allows rendezvous points to share information about active sources. When RPs in remote domains hear about the active sources, they can pass on that information to the local receivers and multicast data can be forwarded between the domains. MSDP allows each domain to maintain an independent RP that does not rely on other domains but enables RPs to forward traffic between domains. PIM-SM is used to forward the traffic between the multicast domains.

Using PIM-SM, multicast sources and receivers register with their local RP by the closest multicast router. The RP maintains information about the sources and receivers for any particular group. RPs in other domains do not have any knowledge about sources located in other domains.

MSDP is required to provide inter-domain multicast services using Any Source Multicast (ASM). Anycast RP for MSDP enables fast convergence when should an MSDP/PIM PR router fail by allowing receivers and sources to rendezvous at the closest RP.

MSDP Procedure

When an RP in a PIM-SM domain first learns of a new sender, for example, by PIM register messages, it constructs a source-active (SA) message and sends it to its MSDP peers. The SA message contains the following fields:

- Source address of the data source
- Group address the data source sends to
- IP address of the RP

Note that an RP that is not a designated router on a shared network do not originate SAs for directly-connected sources on that shared network. It only originates in response to receiving register messages from the designated router.

Each MSDP peer receives and forwards the message away from the RP address in a peer-RPF flooding fashion. The notion of peer-RPF flooding is with respect to forwarding SA messages. The Multicast RPF Routing Information Base (MRIB) is examined to determine which peer towards the originating RP of the SA message is selected. Such a peer is called an RPF peer.

If the MSDP peer receives the SA from a non-RPF peer towards the originating RP, it will drop the message. Otherwise, it forwards the message to all its MSDP peers (except the one from which it received the SA message).

When an MSDP peer which is also an RP for its own domain receives a new SA message, it determines if there are any group members within the domain interested in any group described by an (S,G) entry within the SA message. That is, the RP checks for a (*,G) entry with a non-empty outgoing interface list. This implies that some system in the domain is interested in the group. In this case, the RP triggers an (S,G) join event toward the data source as if a join/prune message was received addressed to the RP. This sets up a branch of the source-tree to this domain. Subsequent data packets arrive at the RP by this tree branch and are forwarded down the shared-tree inside the domain. If leaf routers choose to join the source-tree they have the option to do so according to existing PIM-SM conventions. If an RP in a domain receives a PIM join message for a new group G, the RP must trigger an (S,G) join event for each active (S,G) for that group in its SA cache.

This procedure is called flood-and-join because if any RP is not interested in the group, the SA message can be ignored, otherwise, they join a distribution tree.

MSDP Peering Scenarios

Draft-ietf-mboned-msdp-deploy-nn.txt, *Multicast Source Discovery Protocol (MSDP) Deployment Scenarios*, describes how protocols work together to provide intra- and inter-domain ASM service.

Inter-domain peering:

- Peering between PIM border routers (single-hop peering)
- Peering between non-border routers (multi-hop peering)
- MSDP peering without BGP
- MSDP peering between mesh groups
- MSDP peering at a multicast exchange

Intra-domain peering:

- Peering between routers configured for both MSDP and MBGP
- MSDP peer is not BGP peer (meaning, no BGP peer)

MSDP Peer Groups

MSDP peer groups are typically created when multiple peers have a set of common operational parameters. Group parameters not specifically configured are inherited from the global level.

MSDP Mesh Groups

MSDP mesh groups are used to reduce source active flooding primarily in intra-domain configurations. When a number of speakers in an MSDP domain are fully meshed they can be configured as a mesh group. The originator of the source active message forwards the message to all members of the mesh group. Because of this, forwarding the SA between non-originating members of the mesh group is not necessary.

MSDP Routing Policies

MSDP routing policies allow for filtering of inbound and/or outbound active source messages. Policies can be configured at different levels:

- Global level Applies to all peers
- Group level Applies to all peers in peer-group
- Neighbor level Applies only to specified peer

The most specific level is used. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If no policy is applied source active messages are passed.

Match conditions include:

- Neighbor Matches on a neighbor address is the source address in the IP header of the source active message.
- Route filter Matches on a multicast group address embedded in the source active message
- Source address filter Matches on a multicast source address embedded in the source active message

Multicast in Virtual Private Networks

Draft Rosen

RFC2547bis, *BGP/MPLS IP VPNs*, describes a method of providing a VPN service. A VPN provides secure connections to the network, allowing more efficient service to remote users without compromising the security of firewalls. The Rosen draft specifies the protocols and procedures which must be implemented in order for a service provider to provide a unicast VPN. The draft extends that specification by describing the protocols and procedures which a service provider must implement in order to support multicast traffic in a VPN, assuming that PIM [PIMv2] is the multicast routing protocol used within the VPN, and the SP network can provide PIM as well.

IGMP is not supported for receivers or senders directly attached to the PE.

For further information, refer to the Virtual Private Routed Network Service section of the 7750 SR OS Services Guide.

Multicast Debugging Tools

This section describes multicast debugging tools requirement for the 7750 SR family of products.

The debugging tools for multicast consist out of three elements; mtrace, mstat, and mrinfo.

Mtrace

Assessing problems in the distribution of IP multicast traffic can be difficult. The **mtrace** feature utilizes a tracing feature implemented in multicast routers that is accessed via an extension to the IGMP protocol. The **mtrace** feature is used to print the path from the source to a receiver; it does this by passing a trace query hop-by-hop along the reverse path from the receiver to the source. At each hop, information such as the hop address, routing error conditions and packet statistics should be gathered and returned to the requestor.

Data added by each hop includes:

- Query arrival time
- Incoming interface
- Outgoing interface
- Previous hop router address
- Input packet count
- Output packet count
- Total packets for this source/group
- Routing protocol
- TTL threshold
- Fowarding/error code

The information enables the network administrator to determine:

- Where multicast flows stop
- the flow of the multicast stream

When the trace response packet reaches the first hop router (the router that is directly connected to the source's net), that router sends the completed response to the response destination (receiver) address specified in the trace query.

If some multicast router along the path does not implement the multicast traceroute feature or if there is some outage, then no response is returned. To solve this problem, the trace query includes

a maximum hop count field to limit the number of hops traced before the response is returned. This allows a partial path to be traced.

The reports inserted by each router contain not only the address of the hop, but also the TTL required to forward and some flags to indicate routing errors, plus counts of the total number of packets on the incoming and outgoing interfaces and those forwarded for the specified group. Taking differences in these counts for two traces separated in time and comparing the output packet counts from one hop with the input packet counts of the next hop allows the calculation of packet rate and packet loss statistics for each hop to isolate congestion problems.

Finding the Last Hop Router

The trace query must be sent to the multicast router which is the last hop on the path from the source to the receiver. If the receiver is on the local subnet (as determined using the subnet mask), then the default method is to multicast the trace query to all-routers.mcast.net (224.0.0.2) with a TTL of 1. Otherwise, the trace query is multicast to the group address since the last hop router will be a member of that group if the receiver is. Therefore, it is necessary to specify a group that the intended receiver has joined. This multicast is sent with a default TTL of 64, which may not be sufficient for all cases.

When tracing from a multihomed host or router, the default receiver address may not be the desired interface for the path from the source. In that case, the desired interface should be specified explicitly as the receiver.

Directing the Response

By default, mtrace first attempts to trace the full reverse path, unless the number of hops to trace is explicitly set with the hop option. If there is no response within a 3 second timeout interval, a "*" is printed and the probing switches to hop-by-hop mode. Trace queries are issued starting with a maximum hop count of one and increasing by one until the full path is traced or no response is received. At each hop, multiple probes are sent. The first attempt is made with the unicast address of the host running mtrace as the destination for the response. Since the unicast route may be blocked, the remainder of attempts request that the response be multicast to mtrace.mcast.net (224.0.1.32) with the TTL set to 32 more than what's needed to pass the thresholds seen so far along the path to the receiver. For the last attempts the TTL is increased by another 32.

Alternatively, the TTL may be set explicitly with the TTL option.

For each attempt, if no response is received within the timeout, a "*" is printed. After the specified number of attempts have failed, mtrace will try to query the next hop router with a DVMRP_ASK_NEIGHBORS2 request (as used by the mrinfo program) to determined the router type.

The output of mtrace is a short listing of the hops in the order they are queried, that is, in the reverse of the order from the source to the receiver. For each hop, a line is printed showing the hop number (counted negatively to indicate that this is the reverse path); the multicast routing protocol; the threshold required to forward data (to the previous hop in the listing as indicated by the uparrow character); and the cumulative delay for the query to reach that hop (valid only if the clocks are synchronized). The response ends with a line showing the round-trip time which measures the interval from when the query is issued until the response is received, both derived from the local system clock.

Mtrace/mstat packets use special IGMP packets with IGMP type codes of 0x1E and 0x1F.

Mstat

The **mstat** command adds the capability to show the multicast path in a limited graphic display and provide drops, duplicates, TTLs and delays at each node. This information is useful to the network operator because it identifies nodes with high drop & duplicate counts. Duplicate counts are shown as negative drops.

The output of **mstat** provides a limited pictorial view of the path in the forward direction with data flow indicated by arrows pointing downward and the query path indicated by arrows pointing upward. For each hop, both the entry and exit addresses of the router are shown if different, along with the initial ttl required on the packet in order to be forwarded at this hop and the propagation delay across the hop assuming that the routers at both ends have synchronized clocks. The output consists of two columns, one for the overall multicast packet rate that does not contain lost/sent packets and a column for the (S,G)-specific case. The S,G statistics do not contain lost/sent packets.

Mrinfo

mrinfo is a simple mechanism based on the **ask_neighbors igmp** to display the configuration information from the target multicast router. The type of information displayed includes the Multicast capabilities of the router, code version, metrics, ttl-thresholds, protocols and status. This information, for instance, can be used by network operators to verify if bi-directional adjacencies exist. Once the specified multicast router responds, the configuration is displayed.

Multicast Connection Admission Control (MCAC)

Inspired by network deployments targeted at Ethernet-based triple play aggregation for residential customers, the 7750 has implemented support for Broadcast TV (BTV) distribution. Distribution of BTV services can be facilitated in different ways, such as:

- PIM-SSM based distribution of the channels on a 7750 SR aggregation network, with dynamic IGMP joins from the connected DSLAMs.
- IP-VPN based video distribution.

The capacity taken by the BTV channels may exceed the capacity of the 7750s to access node link (the second mile) or even the capacity of specific network links in the aggregation network (the third mile and fourth mile links). In this case, MCAC is has been implemented to limit the amount of bandwidth consumed by BTV services on these links. As the bandwidth constraint can be on the second-mile link and/or on any network link, the multicast CAC function is applicable to any given interface for both IGMP and PIM, and in case of BTV distribution based on VPLS, on VPLS SAPs and SDPs, where IGMP snooping is enabled.

BTV

Broadcast TV (BTV) is the delivery of TV channels by means of multicast or broadcast to many subscribers at the same time (for example, your standard network television channels). BTV is different from Video On Demand (VOD) as this method is delivered by unicast to specific subscribers.

The capacity taken by the BTV channels may exceed the capacity of the 7750s to access node link (the second mile) or even the capacity of specific network links in the aggregation network (the third mile and fourth mile links).

Potentially, running the multicast CAC function might cause specific channels to be temporarily unavailable to subscribers when overloaded. However, the degradation of the quality of the BTV service offering is avoided.

Overbooking BTV video channels in Telco networks follows the MSO trend regarding "switched broadcasts" where digital broadcast programming is only offered to those nodes where and when subscribers actively request that programming. In other words, BTV channels are offered in an ondemand manner rather than being available at all times on the cable network (which is currently typical). This method enables the creation of a virtual programming capacity without the correlated physical expense of creating and dedicating spectral resources. This trend in the MSO space, that now gets ported in the Telco space, is motivated by planned expansions of the BTV programming lineups, particularly those in bandwidth-hungry high definition television format.

The SR OS (R3.0 and later) allows for some form of CAC for BTV, as it allows limiting the maximum number of channels that can be distributed on a given IP interface (for IGMP and PIM) or VPLS SAP/SDP (with IGMP- snooping). However, this level of control, basically first-come-first-service, is not sufficient in an environment where not all channels are equal in their priority and bandwidth usage.

Simply performing CAC based on a number of channels does not effectively limit the
amount of bandwidth consumed by BTV on any given link as there may be a mix of
Standard Definition (SD) and High Definition (HD) channels being offered, or mix of
MPEG2/MPEG4 SD channels.

To accommodate BTV CAC requirements, the 7750 implements multicast CAC policies that can be applied to an IP interface or VPLS SAP/SDPs. This allows:

- Definition of BTV bundles:
 - → Grouping of MC-group addresses into bundles. Each MC channel can only belong to one specific bundle within the context of one specific policy.
 - → Characterization of channels:
 - Bandwidth Allows differentiation between, for example, SD and HD channels, MPEG2 and MPEG4.
 - Channel type Either mandatory (can never be blocked, and therefore the CAC algorithm assumes that the bandwidth is permanently reserved) or optional (subject to CAC. This may be temporarily unavailable in times of congestion.).
 - Channel class For LAG, the class parameter allows further prioritizing of the mandatory or optional channels. This brings the number of priority levels to four during reshuffles of the joined channels when LAG ports are changing state.

CAC constraints:

- → Interface Defines constraints on the total amount of bandwidth allowed for BTV on a given IP interface for VPLS SAP/SDP entities.
- → Bundle constraints Defines constraints on amount of bandwidth per bundle that is allowed on a given IP interface or VPLS SAP/SDP entities.
- → Note that the constraint of the total amount of multicast traffic per channel class is implicit.
- → CAC constraints take into account the potential use of LAG on access or network ports.

Based on these constraints, 7750 multicast CAC can accept or refuse individual IGMP/PIM joins received on such interface (ingress CAC).

It is important to realize that all CAC functionality is based on configuration rather than measured/real bandwidth.

Table 4 displays an example configuration. Table 5 displays CAC constraints.

Table 4: Bundle definition and Channel Characterization

BTV Channel	Bandwidth in Mbps	Channel Type	Channel Class	Bundle
224.1.1.1	4,0	Mandatory	High	1
224.1.1.6	14,0	Optional	Low	2

Table 5: CAC Constraints

Allowed Bandwidth in Mbps

Interface	750		
Bundle 1	580		
Bundle 2	634		

CAC Algorithm

The multicast CAC algorithm only applies to:

- Channels that have not yet been distributed and that are characterized as optional. Bandwidth for channels characterized as mandatory is pre-reserved on the bundle level and configured on interface level. Channels that are already being distributed will not be dropped. Channels that are already being distributed will not be dropped.
- Channels specified in the CAC policy. Multicast channels not specified in the CAC policy
 are not subject to multicast CAC. Treatment of such unspecified channels is configurable
 as either accept or discard.

The CAC algorithm is applied at both the interface level and the bundle level CAC constraints specified in the policy. Both checks must pass before the channel is allowed.

When evaluating the channels to forward when starting the policy, the available bandwidth fairness between different bundles is maintained and the following applies:

Mandatory high bundle-1, Mandatory high bundle-2, Mandatory high bundle-3, Mandatory high bundle, and so on.

Then:

Mandatory low bundle-1, Mandatory low bundle-2, Mandatory low bundle-3, Mandatory low bundle, and so on.

Then:

Optional high bundle-1, Optional high bundle-2, Optional high bundle-3, Optional high bundle, and so on.

Then:

Optional low bundle-1, Optional low bundle-2, Optional low bundle-3, Optional low bundle, and so on.

This method does not guarantee that all bundles are fully allocated while others are not. However it does ensure that all mandatory high channels are allocated before any mandatory lows are allocated.

Interface-Level CAC

Interface-level CAC constraints are applied to the interface on which the request was received.

The channel is allowed if:

- The channel is characterized as mandatory and the bandwidth for the already distributed mandatory channels plus the bandwidth of this mandatory channel is not greater than the configured amount of mandatory bandwidth.
- The channel is characterized as optional and the bandwidth for the already distributed optional channels plus the bandwidth of this optional channel is not greater than the configured amount of unconstrained-bw, the configured amount of mandatory bandwidth.

No bandwidth (channels) can be allocated once the configured maximum bandwidth for a given interface has been exceeded.

Bundle-Level CAC

Bundle-level CAC is applied to the bundle to which the channel belongs that triggered the CAC algorithm.

The channel is allowed if:

- When it is characterized as mandatory
- When it is an optional channel then the configured bundle bandwidth cannot get exceeded by the distributed bandwidth. The distributed bandwidth equals the bandwidth of all the mandatory channels belonging to that bundle plus the bandwidth of the optional channels being distributed plus the bandwidth of the optional channel that want to join.

Dealing with Configuration Changes

The system handles changes in the BTV bundle definition and CAC constraints efficiently, without dropping any active channels (even when the constraints have become more stringent).

More stringent constraint examples are:

- An operator adds additional mandatory channels to the BTV bundle definition (in which bandwidth needs to be pre-reserved).
- An operator changes a currently inactive channel from an optional to a mandatory state.
- An operator reduces the allowed bandwidth for one of the bundles or at the interface level.

An operator moves channels between bundles.

When these changes become active, all currently active channels continue to be forwarded until they are explicitly released. Channels are not dropped as a result of such policy changes. Additional joins for optional channels are refused until sufficient bandwidth is available to support the more stringent constraints, at which point they become active. Additional joins for existing mandatory channels are never refused.

If a new mandatory channel is defined, or if a currently inactive channel is reconfigured from optional to mandatory, then it will not become active and joins for it will be refused until sufficient bandwidth is available on the link and bundle to enable it.

If the allowed bandwidth is reduced at the interface or bundle level, all active channels are maintained. New joins for optional channels are refused until the new levels are reached.

LAG Interworking

LAG may be used on the second mile (from a DSLAM to a 7750) or on trunk networks.

The CAC policy, which is applied on an interface or VPLS SAP/SDP level, may have to be reevaluated when one of the component links fails (i.e. in the case that BTV multipoint traffic would in normal mode be hashed across the component links).

- The CAC policy allows specifying the amount of component links used for BTV distribution in normal operation as well as the available BTV bandwidth in normal mode of operation on an interface and bundle level.
- The CAC constraints to be applied in degraded mode can be explicitly configured for the interface/bundle. There are multiple constraint-levels defined that can be selected depending on the severity of the failure.

The set of CAC constraints to be used is automatically determined based on the remaining number of operational links. The operation links determine the weight level for the LAG group. The CAC constraints definition specify the weight level to which they apply.

For a LAG of three or more component links (where three CAC constraint levels could be applied), the CAC constraints in the policy could look like:

Table 6: LAG/CAC Constraints

	Allowed Bandwidth in Mbps (normal mode)	Allowed Bandwidth in Mbps (degraded mode 1)	Allowed Bandwidth in Mbps (degraded mode 2)
Weight (tbc)	>=10	>=6	>=2
Interface	750	400	200
Bundle 1	580	300	200
Bundle 2	634	350	250

In the case of reduction of available bandwidth (for example, a component link failure), CAC attempts to fit all mandatory channels. This is performed by re-evaluating the mandatory channels in an arbitrary order using the same two-level CAC algorithm applied at the interface and bundle levels, and using the constraints for the degraded mode of operation. If there is not sufficient capacity to carry all mandatory channels in this degraded mode, some are channels will be dropped. If capacity for BTV is remaining, then subsequently all optional channels are reevaluated in an arbitrary order. Distribution of some of them may be stopped as a consequence.

When a previously failed link becomes re-operational then the CAC algorithm takes into account the return to the normally configured bandwidth, and as a result, starts accepting more optional channels again.

CAC Policy for Split Horizon Groups

When IGMP snooping on residential SAPs was introduced enabling multicast CAC policies to be applied to split horizon groups. When a CAC policies are applied to a split horizon group then member SAPs do not permit policy enforcement configurations.

Multicast Configuration Process Overview

Figure 2 displays the process to configure multicast parameters.

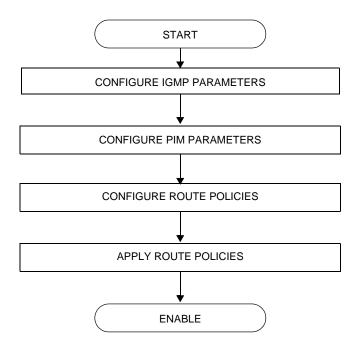

Figure 2: IP Router Configuration Flow

Configuration Notes

This section describes multicast configuration caveats.

General

- A multicast stream is required by one of more multicast clients.
- A multicast stream is offered by one or more multicast servers.

Configuration Notes

Configuring Multicast Parameters with CLI

This section provides information to configure multicast, IGMP, and PIM.

Topics in this section include:

- Multicast Configuration Overview on page 60
- Basic Configuration on page 61
- Common Configuration Tasks on page 64
- Service Management Tasks on page 81

Multicast Configuration Overview

7750 SR routers use IGMP to manage membership for a given multicast session. IGMP is not enabled by default. When enabled, at least one interface must be specified in the IGMP context as IGMP is an interface function. Creating an interface enables IGMP. Traffic can only flow away from the router to an IGMP interface and to and from a PIM interface. A router directly connected to a source must have PIM enabled on the interface to that source. The traffic travels in a network from PIM interface to PIM interface and arrives finally on an IGMP enabled interface.

The IGMP CLI context allows you to specify an existing IP interface and modify the interface-specific parameters. Static IGMP group memberships can be configured to test multicast forwarding without a receiver host. When IGMP static group membership is enabled, data is forwarded to an interface without receiving membership reports from host members.

When static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static IGMP group entries do not generate join messages toward the RP. When a host wants to receive multicast sessions it sends a join message for each multicast group it wants to join. Then, a leave message may be sent for each multicast group it no longer wishes to participate with.

A multicast router keeps a list of multicast group memberships for each attached network, and an interval timer for each membership. Hosts issue a Multicast Group Membership Report when they want to receive a multicast session. The reports are sent to all multicast routers.

PIM is not enabled by default. When PIM is enabled, data is forwarded to network segments with active receivers that have explicitly requested the multicast group. When enabled, at least one interface must be specified in the PIM context as PIM is an interface function. Creating an interface enables PIM.

Basic Configuration

Perform the following basic multicast configuration tasks:

For IGMP:

- Enable IGMP (required)
- Configure IGMP interfaces (required)
- Specify IGMP version on the interface (optional)
- Configure static (S,G)/(*,G) (optional)
- Configure SSM translation (optional)

For PIM:

- Enable PIM (required)
- Add interfaces so the protocol establishes adjacencies with the neighboring routers (required)
- Configure a way to calculate group-to-RP mapping (required) by either:
 - → Static group-to-RP mapping
 - → Enable Candidate RP/Bootstrap mechanism on some routers.
- Enable unicast routing protocols to learn routes towards the RP/source for reverse path forwarding (required)
- Add SSM ranges (optional)
- Enable Candidate BSR (optional)
- Enable Candidate RP (optional)
- Change hello interval (optional)
- Configure route policies (bootstrap-export, bootstrap-import, import join and register)

For MSDP:

- Enable MSDP (required)
- Configure peer
- Configure local address

For MCAC:

- Configure policy name
- Configure bundle parameters
- Specify default action

The following example displays the enabled IGMP and PIM configurations:

```

```

Common Configuration Tasks

The following sections describe basic multicast configuration tasks.

- Configuring IGMP Parameters on page 64
 - → Enabling IGMP on page 64
 - → Configuring an IGMP Interface on page 65
 - → Configuring Static Parameters on page 66
 - → Configuring SSM Translation on page 68
- Configuring PIM Parameters on page 69
 - → Enabling PIM on page 69
 - → Configuring PIM Interface Parameters on page 70
 - → Importing PIM Join/Register Policies on page 75
- Configuring Multicast Source Discovery Protocol (MSDP) Parameters on page 77
- Configuring MCAC Parameters on page 78
- Disabling IGMP or PIM on page 81

Configuring IGMP Parameters

Enabling IGMP

Use the following CLI syntax to enable IGMP.

CLI Syntax: config>router# igmp

The following example displays the detailed output when IGMP is enabled.

Configuring an IGMP Interface

To configure an IGMP interface:

CLI Syntax: config>router# igmp
 interface ip-int-name
 max-groups value
 import policy-name
 version version
 no shutdown

Use the following CLI syntax to configure IGMP interfaces:

The following example displays the IGMP configuration:

```
A:LAX>config>router>igmp# info

interface "lax-sjc"
exit
interface "lax-vls"
exit
interface "pl-ix"
exit
A:LAX>config>router>igmp# exit
```

Configuring Static Parameters

To add an IGMP static multicast source:

```
CLI Syntax: config>router# igmp
    interface ip-int-name
    no shutdown
    static
        group grp-ip-address
        source ip-address
```

Use the following CLI syntax to configure static group addresses and source addresses for the SSM translate group ranges:

The following example displays the configuration:

To add an IGMP static starg entry:

```
CLI Syntax: config>router# igmp
    interface ip-int-name
    no shutdown
    static
        group grp-ip-address
        starg
```

Use the following CLI syntax to configure static group addresses and add a static (*,G) entry:

```
Example: config>router>igmp# interface lax-sjc config>router>igmp>if# static config>router>igmp>if>static# group 230.1.1.1 config>router>igmp>if>static>group# starg config>router>igmp>if>static>group# exit config>router>igmp>if>static# exit config>router>igmp>if+static# exit config>router>igmp>if# exit config>router>igmp+if# exit config>router>igmp#
```

The following example displays the configuration:

```
A:LAX>config>router>igmp# info
      interface "lax-sjc"
              group 230.1.1.1
                 starg
              exit
           exit
       exit
       interface "lax-vls"
          static
             group 229.255.0.2
                 source 172.22.184.197
           exit
       exit
       interface "p1-ix"
       exit
A:LAX>config>router>igmp#
```

Configuring SSM Translation

To configure IGMP parameters:

The following example displays the command usage to configure IGMP parameters:

The following example displays the SSM translation configuration:

```
A:LAX>config>router>igmp# info
_____
      ssm-translate
        grp-range 229.255.0.1 231.2.2.2
            source 10.1.1.1
         exit
      exit
      interface "lax-sjc"
         static
            group 230.1.1.1
                starg
             exit
         exit
      exit
      interface "lax-vls"
         static
             group 229.255.0.2
                source 172.22.184.197
             exit
          exit
      exit
      interface "pl-ix"
      exit
A:LAX>config>router>igmp# exit
```

Configuring PIM Parameters

- Enabling PIM on page 69
- Configuring PIM Interface Parameters on page 70
- Importing PIM Join/Register Policies on page 75

Enabling PIM

When configuring PIM, make sure to enable PIM on all interfaces for the routing instance, otherwise multicast routing errors can occur.

Use the following CLI syntax to enable PIM.

CLI Syntax:config>router# pim

The following example displays the detailed output when PIM is enabled.

```
A:LAX>>config>router# info detail
echo "PIM Configuration"
           no import join-policy
           no import register-policy
           apply-to none
               no bootstrap-import
               no bootstrap-export
                static
                exit
               bsr-candidate
                   shutdown
                   priority 0
                   hash-mask-len 30
                   no address
                exit
                rp-candidate
                    shutdown
                   no address
                   holdtime 150
                   priority 192
                exit
            exit
           no shutdown
       exit
A:LAX>>config>system#
```

Configuring PIM Interface Parameters

The following example displays the command usage to configure PIM interface parameters:

```
Example:A:LAX>config>router# pim
     A:LAX>config>router>pim# interface "system"
     A:LAX>config>router>pim>if# exit
     A:LAX>config>router>pim# interface "lax-vls"
     A:LAX>config>router>pim>if# exit
     A:LAX>config>router>pim# interface "lax-sjc"
     A:LAX>config>router>pim>if# exit
     A:LAX>config>router>pim# interface "p1-ix"
     A:LAX>config>router>pim>if# exit
     A:LAX>config>router>pim# rp
     A:LAX>config>router>pim>rp# static
     A:LAX>config>router>pim>rp>static# address 2.22.187.237
     A:LAX>config>router>...>address# group-prefix 224.24.24.24/32
     A:LAX>config>router>pim>rp>static>address# exit
     A:LAX>config>router>pim>rp>static# exit
     A:LAX>config>router>pim>rp# exit
     A:LAX>config>router>pim#
```

The following example displays the PIM configuration:

```
A:LAX>config>router>pim# info
          interface "system"
           interface "lax-vls"
           exit
           interface "lax-sic"
           interface "pl-ix"
           exit
               static
                   address 2.22.187.237
                    group-prefix 224.24.24.24/32
                   exit
                   address 10.10.10.10
                   exit
               exit
               bsr-candidate
                   shutdown
               rp-candidate
                   shutdown
           exit
A:LAX>config>router>pim#
```

```
Example:A:SJC>config>router# pim
     A:SJC>config>router>pim# interface "system"
     A:SJC>config>router>pim>if# exit
     A:SJC>config>router>pim# interface "sjc-lax"
     A:SJC>config>router>pim>if# exit
     A:SJC>config>router>pim# interface "sjc-nyc"
     A:SJC>config>router>pim>if# exit
     A:SJC>config>router>pim# interface "sjc-sfo"
     A:SJC>config>router>pim>if# exit
     A:SJC>config>router>pim# rp
     A:SJC>config>router>pim>rp# static
     A:SJC>config>router>pim>rp>static# address 2.22.187.237

             exit
          exit
A:WAS>config>router>pim#
```

Importing PIM Join/Register Policies

The import command provides a mechanism to control the (*,G) and (S,G) state that gets created on a router. Import policies are defined in the **config>router>policy-options** context.

Note, in the import policy, if an action is not specified in the entry then the default-action takes precedence. If no entry matches then the default-action also takes precedence. If no default-action is specified, then the default default-action is executed.

Use the following commands to configure PIM parameters:

The following example displays the command usage to apply the policy statement which does not allow join messages for group 229.50.50.208/32 and source 192.168.0.0/16 but allows join messages for 192.168.0.0/16, 229.50.50.208 (see Configuring Route Policy Components on page 684):

The following example displays the PIM configuration:

```
A:LAX>config>router>pim# info
           import join-policy "foo"
           interface "system"
           exit.
           interface "lax-vls"
           interface "lax-sjc"
           interface "pl-ix"
            exit
               static
                   address 2.22.187.237
                      group-prefix 224.24.24.24/3
                   address 10.10.10.10
                   exit
               exit
               bsr-candidate
                    shutdown
```

Common Configuration Tasks

Configuring Multicast Source Discovery Protocol (MSDP) Parameters

Use the following commands to configure basic MSDP parameters:

Use the following CLI syntax to configure MSDP parameters.

```
Example: config>router>msdp# peer 10.20.1.1 config>router>msdp>peer# local-address 10.20.1.6 config>router>msdp>peer# no shutdown config>router>msdp>peer# exit config>router>msdp# no shutdown config>router>msdp#
```

The following example displays the MSDP configuration:

Configuring MCAC Parameters

The MCAC policies can be added to a SAP, spoke SDP, mesh SDP, an IGMP interface, and a PIM interface.

The following example displays the command usage to create MCAC policies.

```
Example: config>router# mcac
config>router>mcac# policy "btv_fr"
config>router>mcac>policy# description "foreign TV offering"
config>router>mcac>policy# bundle "FOR" create
config>router>mcac>policy>bundle# bandwidth 30000
config>router>mcac>policy>bundle# channel 224.0.3.1 224.0.3.1 bw 4000
config>router>mcac>policy>bundle# channel 224.0.3.2 224.0.3.2 bw 4000
config>router>mcac>policy>bundle# channel 224.0.4.1 224.0.4.1 bw 3500 class high type man-
config>router>mcac>policy>bundle# channel 224.0.4.2 224.0.4.2 bw 3500 class high
config>router>mcac>policy>bundle# channel 224.0.4.3 224.0.4.3 bw 2800 type mandatory
config>router>mcac>policy>bundle# channel 224.0.4.4 224.0.4.4 bw 2800
config>router>mcac>policy>bundle# mc-constraints
config>router>mcac>policy>bundle>mc-constraints# level 1 bw 20000
config>router>mcac>policy>bundle>mc-constraints# level 2 bw 20000
config>router>mcac>policy>bundle>mc-constraints# level 3 bw 20000
config>router>mcac>policy>bundle>mc-constraints# level 4 bw 20000
config>router>mcac>policy>bundle>mc-constraints# level 5 bw 20000
config>router>mcac>policy>bundle>mc-constraints# level 6 bw 20000 config>router>mcac>pol-
icy>bundle>mc-constraints# lag-port-down 1 number-down 1 level 1
config>router>mcac>policy>bundle>mc-constraints# lag-port-down 1 number-down 2 level 3
config>router>mcac>policy>bundle>mc-constraints# lag-port-down 1 number-down 3 level 5
config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 1 level 1
config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 2 level 3
config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 3 level 5
config>router>mcac>policy>bundle>mc-constraints# exit
config>router>mcac>policy>bundle# no shutdown
config>router>mcac>policy>bundle# exit
config>router>mcac>policy# exit
config>router>mcac# policy "btv_vl"
config>router>mcac>policy# description "eastern TV offering"
config>router>mcac>policy# bundle "VRT" create
config>router>mcac>policy>bundle# bandwidth 120000
config>router>mcac>policy>bundle# channel 224.1.2.0 224.1.2.4 bw 4000class high type manda-
config>router>mcac>policy>bundle# channel 224.1.2.5 224.1.2.5 bw 20000 type mandatory
config>router>mcac>policy>bundle# channel 224.1.2.10 224.1.2.10 bw 8000 type mandatory
config>router>mcac>policy>bundle# channel 224.2.2.0 224.2.2.4 bw 4000
config>router>mcac>policy>bundle# channel 224.2.2.5 224.2.2.5 bw 10000 class high
config>router>mcac>policy>bundle# channel 224.2.2.6 224.2.2.6 bw 10000 class high
config>router>mcac>policy>bundle# channel 224.2.2.7 224.2.2.7 bw 10000
config>router>mcac>policy>bundle# channel 224.2.2.8 224.2.2.8 bw 10000
config>router>mcac>policy>bundle# mc-constraints
config>router>mcac>policy>bundle>mc-constraints# level 1 bw 60000
config>router>mcac>policy>bundle>mc-constraints# level 2 bw 50000
config>router>mcac>policy>bundle>mc-constraints# level 3 bw 40000
config>router>mcac>policy>bundle>mc-constraints# level 4 bw 30000
config>router>mcac>policy>bundle>mc-constraints\# level 5 bw 20000
config>router>mcac>policy>bundle>mc-constraints# level 6 bw 10000
```

```
config>router>mcac>policy>bundle>mc-constraints# lag-port-down 1 number-down 1 level 1 config>router>mcac>policy>bundle>mc-constraints# lag-port-down 1 number-down 2 level 3 config>router>mcac>policy>bundle>mc-constraints# lag-port-down 1 number-down 3 level 5 config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 1 level 1 config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 2 level 3 config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 2 level 3 config>router>mcac>policy>bundle>mc-constraints# lag-port-down 2 number-down 3 level 5 config>router>mcac>policy>bundle>mc-constraints# exit
config>router>mcac>policy>bundle# no shutdown
config>router>mcac>policy>bundle# exit
config>router>mcac>policy>bundle# exit
```

The following example displays the configuration:

```
*A:ALA-48>config>router>mcac# info
       policy "btv_fr"
           description "foreign TV offering"
           bundle "FOR" create
               bandwidth 30000
               channel 224.0.3.1 224.0.3.1 bw 4000
               channel 224.0.3.2 224.0.3.2 bw 4000
               channel 224.0.4.1 224.0.4.1 bw 3500 class high type mandatory
               channel 224.0.4.2 224.0.4.2 bw 3500 class high
               channel 224.0.4.3 224.0.4.3 bw 2800 type mandatory
               channel 224.0.4.4 224.0.4.4 bw 2800
               mc-constraints

                   level 1 bw 60000
                   level 2 bw 50000
```

Common Configuration Tasks

```
level 3 bw 40000
level 4 bw 30000
level 5 bw 20000
level 6 bw 10000
lag-port-down 1 number-down 1 level 1
lag-port-down 1 number-down 2 level 3
lag-port-down 1 number-down 3 level 5
lag-port-down 2 number-down 1 level 1
lag-port-down 2 number-down 2 level 3
lag-port-down 2 number-down 3 level 5
exit
no shutdown
exit
exit
```

Service Management Tasks

This section discusses the following service management tasks:

Disabling IGMP or PIM on page 81

Disabling IGMP or PIM

Use the following CLI syntax to disable IGMP and PIM:

```
CLI Syntax: config>router#
    igmp
        shutdown
    msdp
        shutdown
    pim
        shutdown
```

The following example displays the command usage to disable multicast:

```
Example: config>router# igmp
config>router>igmp# shutdown
config>router>igmp# exit
config>router#
config>router#
config>router>msdp# shutdown
config>router>msdp# exit
config>router>msdp# exit
config>router# pim
config>router>pim# shutdown
config>router>pim# exit
```

The following example displays the configuration output:

```
A:LAX>config>router# info
echo "IGMP Configuration"
#-----
       igmp
           shutdown
           ssm-translate
              grp-range 229.255.0.1 231.2.2.2
                  source 10.1.1.1
              exit
           exit
           interface "lax-sjc"
               static
                  group 230.1.1.1
                     starg
                 exit
               exit
           exit
           interface "lax-vls"
              static
                  group 229.255.0.2
                      source 172.22.184.197
                  exit
               exit.
           exit
           interface "pl-ix"
           exit
       exit
echo "MSDP Configuration"
       msdp
           shutdown
           peer 10.20.1.1
              local-address 10.20.1.6
           exit
           group "test"
              active-source-limit 50000
              receive-msdp-msg-rate 100 interval 300 threshold 5000
               export "LDP-export"
              import "LDP-import"
              local-address 10.10.10.103
              mode mesh-group
              peer 10.10.10.104
               exit
           exit
echo "PIM Configuration"
     pim
```

```
shutdown
          import join-policy "foo"

Configuration Commands

```
config
router
mc-maximum-routes number [log-only] [threshold threshold]
no mc-maximum-routes
multicast-info policy-name
no multicast-info
```

IGMP Commands

```
config
     - router
             — [no] igmp
                      — [no] interface ip-int-name
                              — [no] group-interface ip-int-name
                                      - [no] shutdown
                              — import policy-name
                              — no import
                              — max-groups value
                              — no max-groups
                              — mcac
                                       mc-constraints
                                               — level level-id bw bandwidth
                                               — no level level-id
                                               — number-down number-lag-port-down level level-id
                                               — no number-down number-lag-port-down
                                               - [no] shutdown
                                       — policy policy-name
                                       — no policy
```

```

Configuration Commands

Generic Commands

shutdown

Syntax [no] shutdown

Context config>router>igmp

config>router>igmp>interface

config>router>igmp>interface>group-interface config>router>igmp>if>mcac>mc-constraints

config>router>pim

config>router>pim>interface *ip-int-name* config>router>pim>rp>rp-candidate config>router>pim>rp>bsr-candidate config>router>pim>rp>ipv6>rp-candidate config>router>pim>rp>ipv6>bsr-candidate config>router>pim>rp>ipv6>bsr-candidate config>router>pim>if>mcac>mc-constraints

config>router>msdp config>router>msdp>peer config>router>msdp>group

config>router>mcac>policy>bundle

config>router>mld

config>router>mld>interface

Description

The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The **shutdown** command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

Default no shutdown: config>router>igmp

config>router>igmp>interface ip-int-name

config>router>pim

config>router>pim>rp>rp-candidate

shutdown: config>router>pim>rp>bsr-candidate

ssm-translate

Syntax ssm-translate

Context config>router>igmp>interface>shutdown

Description This command adds or removes ssm-translate group ranges.

source

Syntax [no] source ip-address

Context config>router>igmp>interface>shutdown>ssm-translate>grp-range

Description This command adds or removes source addresses for the SSM translate group range.

Parameters *ip-address* — a.b.c.d - unicast source address

grp-range

Syntax [no] grp-range start end

Context config>router>igmp>interface>shutdown>ssm-translate

Description This command adds or removes SSM translate group range entries.

Parameters *start* — a.b.c.d - multicast group range start address

end — a.b.c.d - multicast group range end address

description

Syntax description description-string

no description

Context config>router>mcac>policy

config>router>mcac>policy>bundle

Description This command creates a text description stored in the configuration file for a configuration context.

The **description** command associates a text string with a configuration context to help identify the context in

the configuration file.

The **no** form of the command removes any description string from the context.

Default No description associated with the configuration context.

Parameters string — The description character string. Allowed values are any string up to 80 characters long composed

of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the

entire string must be enclosed within double quotes.

mc-maximum-routes

Syntax mc-maximum-routes number [log-only] [threshold threshold]

no mc-maximum-routes

Context config>router

Description This command specifies the maximum number of multicast routes that can be held within a VPN routing/

forwarding (VRF) context. When this limit is reached, a log and SNMP trap are sent. If the **log-only** parameter is not specified and the maximum-routes value is set below the existing number of routes in a

VRF, then no new joins will be processed.

The no form of the command disables the limit of multicast routes within a VRF context. Issue the no form

of the command only when the VPRN instance is shutdown.

Default no mc-maximum-routes

Parameters number — Specifies the maximum number of routes to be held in a VRF context.

Values 1 — 2147483647

 $\textbf{log-only} \ -\!\!\!\!- \ \text{Specifies that if the maximum limit is reached, only log the event.} \ \textbf{log-only} \ \text{does not disable the}$

learning of new routes.

threshold — The percentage at which a warning log message and SNMP trap should be sent.

Values 0 - 100

Default 1

multicast-info

Syntax multicast-info-policy policy-name

no multicast-info-policy

Context configure>router

Description This command configures multicast information policy.

Parameters *policy-name* — Specifies the policy name.

Values 32 chars max

Router IGMP Commands

igmp

Syntax [no] igmp

Context config>router

Description This command enables the Internet Group Management Protocol (IGMP) context. When the context is

created, the IGMP protocol is enabled.

The Internet Group Management Protocol (IGMP) is used by IPv4 systems (hosts and routers) to report their IP multicast group memberships to neighboring multicast routers. An IP multicast router can be a member of one or more multicast groups, in which case it performs both the "multicast router part" of the protocol which collects the membership information needed by its multicast routing protocol, and the "group member part" of the protocol which informs itself and other neighboring multicast routers of its memberships.

The **no** form of the command disables the IGMP instance. To start or suspend execution of IGMP without

affecting the configuration, use the no shutdown command.

Default none

interface

Syntax [no] interface ip-int-name

Context config>router>igmp

Description This command enables the context to configure an IGMP interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of the command deletes the IGMP interface. The **shutdown** command in the **config>router>igmp>interface** context can be used to disable an interface without removing the

configuration for the interface.

Default no interface — No interfaces are defined.

Parameters ip-int-name — The IP interface name. Interface names must be unique within the group of defined IP

interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will

be returned.

If the IP interface exists in a different area it will be moved to this area.

group-interface

Syntax [no] group-interface ip-int-name

Context config>router>igmp>if

Description This command configures an IGMP group interface.

import

Syntax import policy-name

no import

Context config>router>igmp>if

Description This command specifies the import route policy to be used for determining which membership reports are

accepted by the router. Route policies are configured in the config>router>policy-options context.

When an import policy is not specified, all the IGMP reports are accepted.

The **no** form of the command removes the policy association from the IGMP instance.

Default no import — No import policy specified.

Parameters policy-name — The route policy name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>pol-**

icy-options context.

max-groups

Syntax max-groups value

no max-groups

Context config>router>igmp>if

config>router>pim>if

Description This command specifies the maximum number of groups for which IGMP can have local receiver

information based on received IGMP reports on this interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already accepted are not deleted. Only new groups will not be allowed. This command is applicable for IPv4 and

IPv6.

Default 0, no limit to the number of groups.

Parameters value — Specifies the maximum number of groups for this interface.

Values 1 — 16000

Configuration Commands

static

Syntax static

Context config>router>igmp>if

Description This command tests multicast forwarding on an interface without a receiver host. When enabled, data is

forwarded to an interface without receiving membership reports from host members.

Default none

group

Syntax [no] group grp-ip-address

Context config>router>igmp>if>static

Description This command enables the context to add a static multicast group either as a (*,G) or one or more (S,G)

records. Use IGMP static group memberships to test multicast forwarding without a receiver host. When IGMP static groups are enabled, data is forwarded to an interface without receiving membership reports

from host members.

When static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP) are

configured, the static IGMP group entries do not generate join messages toward the RP.

Default none

Parameters grp-ip-address — Specifies an IGMP multicast group address that receives data on an interface. The IP

address must be unique for each static group.

source

Syntax [no] source ip-address

Context config>router>igmp>if>static>group

config>router>igmp>ssm-translate>grp-range

Description This command specifies a IPv4 unicast address that sends data on an interface. This enables a multicast

receiver host to signal a router the group to receive multicast traffic from, and from the source(s) that the

traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The source command in combination with the group is used to create a specific (S,G) static group entry.

Use the ${\bf no}$ form of the command to remove the source from the configuration.

Default none

Parameters *ip-address* — Specifies the IPv4 unicast address.

starg

Syntax [no] starg

Context config>router>igmp>if>static>group

Description This command adds a static (*,G) entry. This command can only be enabled if no existing source addresses

for this group are specified.

Use the **no** form of the command to remove the starg entry from the configuration.

Default none

subnet-check

Syntax [no] subnet-check

Context config>router>igmp>interface

Description This command enables subnet checking for IGMP messages received on this interface. All IGMP packets

with a source address that is not in the local subnet are dropped.

Default enabled

version

Syntax version version

no version

Context config>router>igmp>if

Description This command specifies the IGMP version. If routers run different versions of IGMP, they will negotiate the

lowest common version of IGMP that is supported by hosts on their subnet and operate in that version. For IGMP to function correctly, all routers on a LAN should be configured to run the same version of IGMP on

that LAN.

For IGMPv3, note that a multicast router that is also a group member performs both parts of IGMPv3, receiving and responding to its own IGMP message transmissions as well as those of its neighbors.

Default 3

Parameters *version* — Specifies the IGMP version number.

Values 1, 2, 3

Values >= 1000

query-interval

Syntax query-interval seconds

no query-interval

Context config>router>igmp

Description This command specifies the frequency that the querier router transmits general host-query messages. The

host-query messages solicit group membership information and are sent to the all-systems multicast group

address, 224.0.0.1.

Default 125

seconds — The time frequency, in seconds, that the router transmits general host-query messages.

Values 2 — 1024

query-last-member-interval

Syntax query-last-member-interval seconds

Context config>router>igmp

Description This command configures the frequency at which the querier sends group-specific query messages including

messages sent in response to leave-group messages. The lower the interval, the faster the detection of the

loss of the last member of a group.

Default 1

Parameters seconds — Specifies the frequency, in seconds, at which query messages are sent.

Values 1 — 1024

query-response-interval

Syntax query-response-interval seconds

Context config>router>igmp

Description This command specifies how long the querier router waits to receive a response to a host-query message

from a host.

Default 10

Parameters seconds — Specifies the the length of time to wait to receive a response to the host-query message from the

host.

Values 1 — 1023

robust-count

Syntax robust-count robust-count

no robust-count

Context config>router>igmp

Description This command configures the robust count. The robust-count variable allows tuning for the expected packet

loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased.

Default 2

Parameters *robust-count* — Specify the robust count value.

Values 2 — 10

ssm-translate

Syntax ssm-translate

Context config>router>igmp

Description This command enables the context to configure group ranges which are translated to SSM (S,G) entries. If

the static entry needs to be created, it has to be translated from a IGMPv1 IGMPv2 request to a Source Specific Multicast (SSM) join. An SSM translate source can only be added if the starg command is not enabled. An error message is generated if you try to configure the **source** command with **starg** command

enabled.

grp-range

Syntax [no] grp-range start end

Context config>router>igmp>ssm-translate

Description This command is used to configure group ranges which are translated to SSM (S,G) entries.

Parameters *start* — An IP address that specifies the start of the group range.

end — An IP address that specifies the end of the group range. This value should always be greater than or

equal to the value of the *start* value.

source

Syntax [no] source ip-address

Context config>router>igmp>ssm-translate>grp-range

Description This command specifies the source IP address for the group range. Whenever a (*,G) report is received in

the range specified by grp-range start and end parameters, it is translated to an (S,G) report with the value

of this object as the source address.

Parameters *ip-address* — Specifies the IP address that will be sending data.

tunnel-interface

Syntax [no] tunnel-interface {rsvp-p2mp | lsp-name | [sender | sender-address] | ldp-p2mp | p2mp-id

sender sender-address [root-node]}

Context config>router

config>router>igmp

Description This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are

forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel

interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces in PIM and associate each to a different RSVP P2MP LSP. P2mp-ID is required to configure LDP P2MP LSP tunnel interfaces. Sender address for a tunnel itnerface must be specified only on the leaf node.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two:s) nor contain a ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

Default none

Parameters rsvp-p2mp lsp-name — Specifies the LSP. The LSP name can be up to 32 characters long and must be

unique.

p2mp-id — Identifier used for signaling mLDP P2MP LSP.

Values 1 – 4294967296 (On Leaf Node)

Values 1-8192 (On Root Node)

static

Syntax static

Context config>router>igmp>tunnel-interface

Description This command provides the context to configure static multicast receiver hosts on a tunnel interface

associated with an RSVP P2MP LSP.

When enabled, data is forwarded to an interface without receiving membership reports from host members.

Default none

group

Syntax [no] group grp-ip-address

Context config>router>igmp>tunnel-interface>static

Description This command enables the context to add a static multicast group either as a (*,G) or one or more (S,G)

records.

The user can assign static multicast group joins to a tunnel interface associated with an RSVP P2MP LSP. Note that a given <*,G> or <S,G> can only be associated with a single tunnel interface.

A multicast packet which is received on an interface and which succeeds the RPF check for the source address will be replicated and forwarded to all OIFs which correspond to the branches of the P2MP LSP. The packet is sent on each OIF with the label stack indicated in the NHLFE of this OIF. The packets will also be replicated and forwarded natively on all OIFs which have received IGMP or PIM joins for this <S,G>.

The multicast packet can be received over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.

Default none

Parameters grp-ip-address — Specifies a multicast group address that receives data on a tunnel interface. The IP

address must be unique for each static group.

source

Syntax [no] source ip-address

Context config>router>igmp>tunnel-interface>static>group

Description This command specifies a IPv4 unicast address of a multicast source. The source command is mutually

exclusive with the specification of individual sources for the same group. The source command in combination with the group is used to create a specific (S,G) group entry in a static group join on a tunnel

interface associated with a P2MP RSVP LSP.

The **no** form of the command removes the source from the configuration.

Default none

Parameters *ip-address* — Specifies the IPv4 unicast address.

starg

Syntax [no] starg

Context config>router>igmp>tunnel-interface>static>group

Description This command adds a static (*,G) group entry in a static group join on a tunnel interface associated with a

P2MP RSVP LSP.

This command can only be enabled if no existing source addresses for this group are specified.

The **no** form of the command removes the starg entry from the configuration.

Default none

Router PIM Commands

pim

Syntax [no] pim

Context config>router

Description This command configures a Protocol Independent Multicast (PIM) instance.

PIM is used for multicast routing within the network. Devices in the network can receive the multicast feed requested and non-participating routers can be pruned. The 7750 SR OS supports PIM sparse mode (PIM-

SM).

Default not enabled

interface

Parameters

Parameters [no] interface ip-int-name

Context config>router>pim

Description This command creates a logical IP routing interface.

Interface names are case-sensitive and must be unique within the group of defined IP interfaces defined for **config router interface** and **config service ies interface**. Interface names must not be in the dotted decimal notation of an IP address. For example, the name "1.1.1.1" is not allowed, but "int-1.1.1.1" is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it is confusing.

The **no** form of the command removes the IP interface and all the associated configurations.

Default No interfaces or names are defined within PIM.

ip-int-name — The name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

Values 1 — 32 alphanumeric characters.

If the *ip-int-name* already exists, the context is changed to maintain that IP interface. If *ip-int-name* does not exist, the interface is created and the context is changed to that interface for further command processing.

apply-to

Syntax apply-to {ies | non-ies | all | none}

Context config>router>pim

Description This command creates a PIM interface with default parameters.

If a manually created or modified interface is deleted, the interface will be recreated when (re)processing the **apply-to** command and if PIM is not required on a specific interface a shutdown should be executed.

The **apply-to** command is first saved in the PIM configuration structure. Then, all subsequent commands either create new structures or modify the defaults as created by the apply-to command.

Default none (keyword)

Parameters ies — Creates all IES interfaces in PIM.

non-ies — Non-IES interfaces are created in PIM.

all — All IES and non-IES interfaces are created in PIM.

none — Removes all interfaces that are not manually created or modified. It also removes explicit no interface commands if present.

assert-period

Syntax assert-period assert-period

no assert-period

Context config>router>pim>if

Description This command configures the period for periodic refreshes of PIM Assert messages on an interface.

The **no** form of the command removes the assert-period from the configuration.

Default no assert-period

Parameters assert-period — Specifies the period for periodic refreshes of PIM Assert messages on an interface.

Values 1 — 300 seconds

bfd-enable

Parameters [no] bfd-enable

Context config>router>pim>interface

Description This command enables the use of bi-directional forwarding (BFD) to control the state of the associated

protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the

BFD are set via the BFD command under the IP interface.

The no form of this command removes BFD from the associated IGP protocol adjacency.

Default no bfd-enable

enable-mdt-spt

Syntax enable-mdt-spt

no enable-mdt-spt

Context config>router>pim

Description This command is used to enable SPT switchover for default MDT. On enable, PIM instance resets all MDTs

and reinitiate setup.

The no form of the command disables SPT switchover for default MDT. On disable, PIM instance resets all

MDTs and reinitiate setup.

Default no enable-mdt-spt

import

import {join-policy | register-policy} [policy-name [.. policy-name]] **Syntax**

no import {join-policy | register-policy}

Context config>router>pim

Description This command specifies the import route policy to be used. Route policies are configured in the

config>router>policy-options context.

When an import policy is not specified, BGP routes are accepted by default. Up to five import policy names

can be specified.

The **no** form of the command removes the policy association from the instance.

Default no import join-policy

no import register-policy

Parameters join-policy — Use this command to filter PIM join messages which prevents unwanted multicast streams

from traversing the network.

register-policy — This keyword filters register messages. PIM register filters prevent register messages from being processed by the RP. This filter can only be defined on an RP. When a match is found, the

RP immediately sends back a register-stop message.

policy-name — The route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. Route policies are configured in the

config>router>policy-options context.

ipv4-multicast-disable

Syntax [no] ipv4-multicast-disable

Context configure>router>pim

configure>router>pim>interface

Description This command administratively disables/enables PIM operation for IPv4.

Default no ipv4-multicast-disable

lag-usage-optimization

Syntax [no] lag-usage-optimization

Context configure>router>pim

Description This command specifies whether the router should optimize usage of the LAG such that traffic for a given

multicast stream destined to an IP interface using the LAG is sent only to the forwarding complex that owns

the LAG link on which it will actually be forwarded.

Changing the value causes the PIM protocol to be restarted.

If this optimization is disabled, the traffic will be sent to all the forwarding complexes that own at least one

link in the LAG.

Note that changes made for 9G multicast hashing causes Layer 4 multicast traffic to not hashed.

This is independent whether **lag-usage-optimization** is enabled or disabled.

mc-ecmp-balance

Syntax [no] mc-ecmp-balance

Context configure>router>pim

Description This command enables multicast balancing of traffic over ECMP links. When enabled, each multicast

stream that needs to be forwarded over an ECMP link will be re-evaluated for the total multicast bandwidth

utilization. Re-evaluation occurs on the ECMP interface in question.

The **no** form of the command disables the multicast balancing.

mc-ecmp-balance-hold

Syntax mc-ecmp-balance-hold minutes

no mc-ecmp-balance-hold

Context configure>router>pim

Description This command configures the hold time for multicast balancing over ECMP links.

Parameters minutes — Specifies the hold time, in minutes, that applies after an interface has been added to the ECMP

link.

mc-ecmp-hashing-enabled

Syntax [no] mc-ecmp-hashing-enabled

Context configure>router>pim

Description This command enables hash-based multicast balancing of traffic over ECMP links and causes PIM joins to

be distributed over the multiple ECMP paths based on a hash of S and G (and possibly

next-hop IP). When a link in the ECMP set is removed, the multicast streams that were using that link are redistributed over the remaining ECMP links using the same hash algorithm. When a link is added to the ECMP set new joins may be allocated to the new link based on the hash algorithm, but existing multicast

streams using the other ECMP links stay on those links until they are pruned.

Hash-based multicast balancing is supported for both IPv4 and IPv6.

This command is mutually exclusive with the mc-ecmp-balance command in the same context.

The no form of the command disables the hash-based multicast balancing of traffic over ECMP links.

Default no mc-ecmp-hashing-enabled

ipv6-multicast-disable

Syntax ipv6-multicast-disable

Context configure>router>pim

configure>router>pim>interface

Description This command administratively disables/enables PIM operation for IPv6.

Default ipv6-multicast-disable

bsm-check-rtr-alert

Syntax [no] bsm-check-rtr-alert

Context config>router>pim>interface

Description This command enables the checking of the router alert option in the bootstrap messages received on this

interface.

Default no bsm-check-rtr-alert

hello-interval

Syntax hello-interval hello-interval

no hello-interval

Context config>router>pim>interface

Description This command configures the frequency at which PIM Hello messages are transmitted on this interface.

The **no** form of this command reverts to the default value of the hello-interval.

Default 30

Parameters hello-interval — Specifies the hello interval in seconds. A 0 (zero) value disables the sending of hello

messages (the PIM neighbor will never timeout the adjacency).

Values 0 - 255 seconds

hello-multiplier

Syntax hello-multiplier deci-units

no hello-multiplier

Context config>router>pim>interface

Description This command configures the multiplier to determine the holdtime for a PIM neighbor on this interface.

The hello-multiplier in conjunction with the hello-interval determines the holdtime for a PIM neighbor.

Parameters deci-units — Specify the value, specified in multiples of 0.1, for the formula used to calculate the hello-

holdtime based on the hello-multiplier:

(hello-interval * hello-multiplier) / 10

This allows the PIMv2 default timeout of 3.5 seconds to be supported.

Values 20 — 100

Default 35

improved-assert

Syntax [no] improved-assert

Context config>router>pim>interface

Description The PIM assert process establishes a forwarder for a LAN and requires interaction between the control and

forwarding planes. The assert process is started when data is received on an outgoing interface meaning that

duplicate traffic is forwarded to the LAN until the forwarder is negotiated among the routers.

When the **improved-assert** command is enabled, the PIM assert process is done entirely in the control plane. The advantages are that it eliminates duplicate traffic forwarding to the LAN. It also improves

performance since it removes the required interaction between the control and data planes.

NOTE: improved-assert is still fully interoperable with the draft-ietf-pim-sm-v2-new-xx, *Protocol Independent Multicast - Sparse Mode (PIM-SM): Revised*, and RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM)*, implementations. However, there may be conformance tests that may fail if the tests expect control-data plane interaction in determining the assert winner. Disabling the **improved-assert** command when performing conformance tests is recommended.

Default enabled

multicast-senders

Syntax multicast-senders {auto | always | never}

no multicast-senders

Context config>router>pim>interface

Description This command configures how traffic from directly-attached multicast sources should be treated on

broadcast interfaces. It can also be used to treat all traffic received on an interface as traffic coming from a directly-attached multicast source. This is particularly useful if a multicast source is connected to a point-to-

point or unnumbered interface.

Default auto

Parameters auto — Specifies that, on broadcast interfaces, the forwarding plane performs subnet-match check on multicast packets received on the interface to determine if the packet is from a directly-attached source.

On unnumbered/point-to-point interfaces, all traffic is implicitly treated as coming from a remote

source.

always — Treats all traffic received on the interface as coming from a directly-attached multicast source.

never — Specifies that, on broadcast interfaces, traffic from directly-attached multicast sources will not be forwarded. Note that traffic from a remote source will still be forwarded if there is a multicast state for it. On unnumbered/point-to-point interfaces, it means that all traffic received on that interface must not

be forwarded.

priority

Syntax priority dr-priority

no priority

Context config>router>pim>interface

Description This command sets the priority value to elect the designated router (DR). The DR election priority is a 32-bit

unsigned number and the numerically larger priority is always preferred.

The **no** form of the command restores the default values.

Default 1

erauit

Parameters priority — Specifies the priority to become the designated router. The higher the value, the higher the

priority.

Values 1 — 4294967295

priority

Syntax priority bootstrap-priority

no priority

Context config>router>pim>rp>bsr-candidate

Description This command configures the bootstrap priority of the router. The RP is sometimes called the bootstrap

router. The priority determines if the router is eligible to be a bootstrap router. In the case of a tie, the router

with the highest IP address is elected to be the bootstrap router.

Default 0

Parameters bootstrap-priority — Specifies the priority to become the bootstrap router. The higher the value, the higher

the priority. A 0 value the router is not eligible to be the bootstrap router. A value of 1 means router is

the least likely to become the designated router.

Values 0 - 255

priority

Syntax priority priority

no priority

Context config>router>pim>rp>rp-candidate

config>router>pim>rp>ipv6>rp-candidate

Description This command configures the Candidate-RP priority for becoming a rendezvous point (RP). This value is

used to elect RP for a group range.

Default 192

Parameters priority — Specifies the priority to become a rendezvous point (RP). A value of 0 is considered as the

highest priority.

Values 0-255

sticky-dr

Syntax sticky-dr [priority dr-priority]

no sticky-dr

Context config>router>pim>interface

Description This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent

on this interface when elected as the designateed router (DR) will be modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the

old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR

comes back up.

The no form of the command disables sticky-dr operation on this interface.

Default disabled

Parameters priority — Sets the DR priority to be sent in PIM Hello messages following the election of that

interface as the DR, when sticky-dr operation is enabled.

Values 1 — 4294967295

three-way-hello

Syntax three-way-hello [compatibility-mode]

no three-way-hello

Context config>router>pim>interface

Description This command configures the compatibility mode to enable three-way hello. By default value is disabled on

all interface which specifies that the standard two- way hello is supported. When enabled, the three way

hello is supported.

Default no three-way-hello

tracking-support

Syntax [no] tracking-support

Context config>router>pim>interface

Description This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the

router's capability to enable join message suppression. This capability allows for upstream routers to

explicitly track join membership.

Default no tracking-support

rp

Syntax rp

Context config>router>pim

Description This command enables the context to configure rendezvous point (RP) parameters. The address of the root

of the group's shared multicast distribution tree is known as its RP. Packets received from a source upstream

and join messages from downstream routers rendezvous at this router.

If this command is not enabled, then the router can never become the RP.

ipv6

Syntax ipv6

Context config>router>pim>rp

Description This command enables the configure IPv6 parameters.

anycast

Syntax [no] anycast rp-ip-address

Context config>router>pim>rp

config>router>pim>rp>ipv6

Description This command configures a PIM anycast protocol instance for the RP being configured. Anycast enables

fast convergence when a PIM RP router fails by allowing receivers and sources to rendezvous at the closest

RP.

The **no** form of the command removes the anycast instance from the configuration.

Default none

Parameters *rp-ip-address* — Configure the loopback IP address shared by all routes that form the RP set for this anycast

instance. Only a single address can be configured. If another anycast command is entered with an address then the old address will be replaced with the new address. If no ip-address is entered then the

command is simply used to enter the anycast CLI level.

Values Any valid loopback address configured on the node.

rp-set-peer

Syntax [no] rp-set-peer ip-address

Context config>router>pim>rp>anycast

config>router>pim>rp>ipv6>anycast

Description This command configures a peer in the anycast rp-set. The address identifies the address used by the other

node as the RP candidacy address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value

than any other configured RP candidate that is not a member of this rp-set.

Although there is no set maximum number of addresses that can be configured in an rp-set, up to 15 IP

addresses is recommended.

The **no** form of the command removes an entry from the list.

Default None

Parameters *ip-address* — Specifies a peer in the anycast rp-set.

Values Any valid ip-address within the scope outlined above.

bsr-candidate

Syntax bsr-candidate

Context config>router>pim>rp

config>router>pim>rp>ipv6

Description This command enables the context to configure Candidate Bootstrap (BSR) parameters.

rp-candidate

Syntax rp-candidate

Context config>router>pim>rp

config>router>pim>rp>ipv6

Description This command enables the context to configure the Candidate RP parameters.

Routers use a set of available rendezvous points distributed in Bootstrap messages to get the proper group-to-RP mapping. A set of routers within a domain are also configured as candidate RPs (C-RPs); typically

these will be the same routers that are configured as candidate BSRs.

Every multicast group has a shared tree through which receivers learn about new multicast sources and new

receivers learn about all multicast sources. The rendezvous point (RP) is the root of this shared tree.

Default shutdown

static

Syntax static

Context config>router>pim>rp

config>router>pim>rp>ipv6

Description This command enables the context to configure static Rendezvous Point (RP) addresses for a multicast

group range.

Entries can be created or destroyed. If no IP addresses are configured in the

config>router>pim>rp>static>address context, then the multicast group to RP mapping is derived from

the RP-set messages received from the Bootstrap Router.

address

Syntax address ip-address

Context config>router>pim>rp>bsr-candidate

config>router>pim>rp>ipv6>bsr-cand

Description This command is used to configure the candidate BSR IP address. This address is for Bootstrap router

election.

Default none

Parameters ip-address — The ip-address portion of the address command specifies the IP host address that will be used

by the IP interface within the subnet. This address must be unique within the subnet and specified in

dotted decimal notation.

Values 1.0.0.0 - 223.255.255.255

address

Syntax [no] address ip-address

Context config>router>pim>rp>rp-candidate

config>router>pim>rp>ipv6>bsr-cand

Description This command configures the local RP address. This address is sent in the RP candidate advertisements to

the bootstrap router.

Default none

> Values 1.0.0.0 - 223.255.255.255

address

Syntax address ip-address

no address

Context config>router>pim>rp>static

config>router>pim>rp>ipv6>static

Description This command indicates the Rendezvous Point (RP) address that should be used by the router for the range

of multicast groups configured by the range command.

Default none **Parameters**

ip-address — The static IP address of the RP. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

Values 1.0.0.0 – 223.255.255.255

embedded-rp

Syntax [no] embedded-rp

Context config>router>pim>rp>ipv6

Description This command enables the context to configure embedded RP parameters.

Embedded RP is required to support IPv6 inter-domain multicast because there is no MSDP equivalent in IPv6.

The detailed protocol specification is defined in RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*. This RFC describes a multicast address allocation policy in which the address of the RP is encoded in the IPv6 multicast group address, and specifies a PIM-SM group-to-RP mapping to use the encoding, leveraging, and extending unicast-prefix-based addressing. This mechanism not only provides a simple solution for IPv6 inter-domain ASM but can be used as a simple solution for IPv6 intradomain ASM with scoped multicast addresses as well. It can also be used as an automatic RP discovery mechanism in those deployment scenarios that would have previously used the Bootstrap Router protocol (BSR).

The **no** form of the command disables embedded RP.

group-range

Syntax [no] group-range ipv6-address/prefix-length

Context config>router>pim>ipv6>rp>embedded-rp

Description This command defines which multicast groups can embed RP address information besides FF70::/12.

Embedded RP information is only used when the multicast group is in FF70::/12 or the configured group

range.

Parameters *ipv6-address/prefix-length* — Specifies the group range for embedded RP.

Values ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0..FFFF]H d: [0..255]D

prefix-length: 16 — 128

group-range

Syntax [no] group-range {grp-ip-address/mask | grp-ip-address netmask}

Context config>router>pim>rp>rp-candidate

config>router>pim>rp>static>rp>ipv6>rp-candidate

Description This command configures the address ranges of the multicast groups for which this router can be an RP.

Default none

Parameters grp-ip-address — The multicast group IP address expressed in dotted decimal notation.

> **Values** 224.0.0.0 - 239.255.255.255

mask — The mask associated with the IP prefix expressed as a mask length or in dotted decimal notation; for example /16 for a sixteen-bit mask. The mask can also be entered in dotted decrnial notation (255.255.0.0).

Values 4 - 32

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

group-range

Syntax [no] group-range {ip-prefix/mask | ip-prefix netmask}

Context config>router>pim>ssm-groups

Description This command configures the address ranges of the multicast groups for this router. When there are

parameters present, the command configures the SSM group ranges for IPv6 addresses and netmasks.

Default none

Parameters ip-prefix/mask — The IP prefix in dotted decimal notation for the range used by the ABR to advertise that

summarizes the area into another area.

Values ipv4-prefix: a.b.c.d ipv4-prefix-le: 0 - 32

> x:x:x:x:x:x:x (eight 16-bit pieces) ipv6-prefix:

> > x:x:x:x:x:d.d.d.d x: [0..FFFF]H d: [0..255]D

0 - 128ipv6-prefix-le:

Values 0 — 32 (mask length), 0.0.0.0 — 255.255.255.255 (dotted decimal)

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

holdtime

Syntax holdtime holdtime

no holdtime

Context config>router>pim>rp>rp-candidate

config>router>pim>rp>ipv6>rp-candidate

Description This command configures the length of time, in seconds, that neighbors should consider the sending router

to be operationally up. A local RP cannot be configured on a logical router.

Parameters *holdtime* — Specifies the hold time, in seconds.

Values 5 — 255

group-prefix

Syntax [no] group-prefix {grp-ip-address/mask | grp-ip-address netmask}

Context config>router>pim>rp>static>address

config>router>pim>rp>ipv6>static>address

Description This command specifies the range of multicast group addresses which should be used by the router as the

Rendezvous Point (RP). The config>router>pim>rp>static>address a.b.c.d implicitly defaults to deny all for all multicast groups (224.0.0.0/4). A group-prefix must be specified for that static address. This command

does not apply to the whole group range.

The **no** form of the command removes the group-prefix from the configuration.

Default none

Parameters grp-ip-address — The multicast group IP address expressed in dotted decimal notation.

Values 224.0.0.0 — 239.255.255.255

mask — The mask associated with the IP prefix expressed as a mask length or in dotted decimal notation; for example /16 for a sixteen-bit mask. The mask can also be entered in dotted decimal notation

(255.255.0.0).

Values 4 — 32

netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

override

Syntax [no] override

Context config>router>pim>rp>static>address

config>router>pim>rp>ipv6>static>address

Description This command changes the precedence of static RP over dynamically learned Rendezvous Point (RP).

When enabled, the static group-to-RP mappings take precedence over the dynamically learned mappings.

Default no override

non-dr-attract-traffic

Syntax [no] non-dr-attract-traffic

Context config>router>pim

Description This command specifies whether the router should ignore the designated router state and attract traffic even

when it is not the designater router.

An operator can configure an interface (router or IES or VPRN interfaces) to IGMP and PIM. The interface IGMP state will be synchronized to the backup node if it is associated with the redundant peer port. The interface can be configured to use PIM which will cause multicast streams to be sent to the elected DR only. The DR will also be the router sending traffic to the DSLAM. Since it may be required to attract traffic to both routers a flag non-dr-attract-trafffic can be used in the PIM context to have the router ignore the DR state and attract traffic when not DR. Note that while using this flag the router may not send the stream down to the DSLAM while not DR.

When enabled, the designated router state is ignored. When disabled, **no non-dr-attract-traffic**, the designated router value is honored.

Default no non-dr-attract-traffic

rpf6-table

Syntax rpf6-table {rtable6-m | rtable6-u | both}

no rpf6-table

Context config>router>pim

config>router>msdp

Description This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF)

interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However the operator can specify the following:

a) Use unicast route table only

b) Use multicast route table only or

c) Use both the route tables.

Parameters rtable6-m — Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

rtable6-u — Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

both — Will always lookup first in the multicast route table and if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable6-m is checked before rtable6-u.

Default rtable-u

sa-timeout

Syntax sa-timeout seconds

no sa-timeout

Context config>router>msdp

Description This command configures the value for the SA entries in the cache. If these entries are not refreshed within

the timeout value then they are removed from the cache. Normally the entries are refreshed at least once a minute. But under high load with many of MSDP peers the refresh cycle could be incomplete. A higher

timeout value (more then 90) could be useful to prevent unstabilities in the MSDP cache.

Default 90

Parameters seconds — Specifies the time, in seconds, to wait for a response from the peer before declaring the peer

unavailable.

Values 90 — 600

spt-switchover-threshold

Syntax spt-switchover-threshold {grp-ip-address/mask | grp-ip-address netmask} spt-threshold

no spt-switchover-threshold {*grp-ip-address/mask* | *grp-ip-address netmask*}

Context config>router>pim

Description This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known,

a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured

threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

Parameters grp-ip-address — The multicast group IP address expressed in dotted decimal notation.

Values 224.0.0.0 — 239.255.255.255

spt-threshold — Specifies the configured threshold in kilobits per second (kbps) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold.

Values 1 — 4294967294 | infinity

mask — The mask associated with the IP prefix expressed as a mask length or in dotted decimal notation; for example /16 for a sixteen-bit mask. The mask can also be entered in dotted decimal notation (255.255.0.0).

Values 4 — 32

infinity — When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected. The threshold, in kilobits per second (KBPS), value is 4294967295.

ssm-groups

Syntax [no] ssm-groups

Context config>router>pim

Description This command enables the context to enable an ssm-group configuration instance.

bootstrap-export

Syntax bootstrap-export *policy-name* [..*policy-name*]

Context config>router>pim>rp

Description Use this command to apply export policies to control the flow of bootstrap messages from the RP, and apply

them to the PIM configuration. Up to 5 policy names can be specified.

Default no bootstrap-export

Parameters policy-name — Specify the export policy name up to 32 characters in length.

bootstrap-import

Syntax bootstrap-import policy-name [..policy-name]

Context config>router>pim>rp

Description Use this command to apply import policies to control the flow of bootstrap messages to the RP, and apply

them to the PIM configuration. Up to 5 policy names can be specified.

Default no bootstrap-import

Parameters policy-name — Specify the import policy name up to 32 characters in length.

hash-mask-len

Syntax hash-mask-length

no hash-mask-len

Context config>router>pim>rp>bsr-candidate

config>router>pim>rp>ipv6>bsr-candidate

Description This command is used to configure the length of a mask that is to be combined with the group address before

the hash function is called. All groups with the same hash map to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This mechanism is used to map one group or multiple

groups to an RP.

Parameters *hash-mask-length* — The hash mask length.

Values 0 - 32

Router Multicast Source Discovery Protocol (MSDP) Commands

msdp

Syntax [no] msdp

Context config>router

Description This command enables a Multicast Source Discovery Protocol (MSDP) instance. When an MSDP instance

is created, the protocol is enabled. To start or suspend execution of the MSDP protocol without affecting the

configuration, use the [no] shutdown command.

The no form of the command deletes the MSDP protocol instance removing all associated configuration

parameters.

Default no msdp

Interactions: In order for the MSDP protocol to function at least one peer must be configured.

When MSDP is configured and started an appropriate event message should be generated.

When the no form of the command is executed all sessions must be terminated and an appropriate event

message should be generated.

When all peering sessions are terminated an event message per peer is not required.

active-source-limit

Syntax active-source-limit number

no active-source-limit

Context config>router>msdp

config>router>msdp>group config>router>msdp>group>peer

Description This option controls the maximum number of active source messages that will be accepted by Multicast

Source Discovery Protocol (MSDP). This effectively controls the number of active sources that can be

stored on the system.

The no form of this command reverts the number of source message limit to default operation

Default No limit is placed on the number of source active records

Parameters number — This parameter defines how many active sources can be maintained by MSDP.

Values 0 - 1000000

receive-msdp-msg-rate

Syntax receive-msg-rate number interval seconds [threshold number]

no receive-msg-rate

Context config>router>msdp

config>router>msdp>peer config>router>msdp>group config>router>msdp>source

Description This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read

from the TCP session. It is possible that an MSDP/RP router may receive a large number of MSDP protocol

message packets in a particular source active message.

The **no** form of this command reverts this active-source limit to default operation

Default No limit is placed on the number of MSDP and source active limit messages will be accepted.

Parameters *number* — Defines the number of MSDP messages (including source active messages) that are read from

the TCP session per the number of seconds.

Values 10 — 10000

Default 0

interval seconds — This defines the time that together with the number parameter defines the number of MSDP messages (including source active messages) that are read from the TCP session within the configured number of seconds.

Values 1 — 600

Default 0

threshold — This number reflects the number of MSDP messages can be processed before the MSDP message rate limiting function described above is activated; this is of use in particular during at system startup and initialization.

Values 1 — 1000000

Default 0

Interactions: Once the number of MSDP packets (including source active messages) defined in the threshold have been

processed the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP

session until the time (seconds) has elapsed.

authentication-key

Syntax authentication-key [authentication-key|hash-key] [hash|hash2]

no authentication-key

Context config>router>msdp>peer

config>router>msdp>group>peer

Description This command configures a Message Digest 5 (MD5) authentication key to be used with a specific Multicast

Source Discovery Protocol (MSDP) peering session. The authentication key must be configured per peer as

such no global or group configuration is possible.

Default Authentication-key. All MSDP messages are accepted and the MD5 signature option authentication key is

disabled.

Parameters authentication-key — The authentication key. Allowed values are any string up to 16 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

hash-key — The hash key. The key can be any combination of ASCII characters up to 33 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks

("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

data-encapsulation

Syntax [no] data-encapsulation

Context config>router>msdp

Description This command configures a rendezvous point (RP) using Multicast Source Discovery Protocol (MSDP) to

encapsulate multicast data received in MSDP register messages inside forwarded MSDP source-active

messages.

Default data-encapsulation

default-peer

Syntax default-peer

no default-peer

Context config>router>msdp>peer

config>router>msdp>group>peer

Description Using the default peer mechanism a peer can be selected as the default Multicast Source Discovery Protocol

(MSDP) peer, as a result all source-active messages from the peer will be accepted without the usual peer-

reverse-path-forwarding (RPF) check.

The MSDP peer-RPF check is different from the normal multicast RPF checks. The peer-RPF check is used to stop source-active messages from looping. A router validates source-active messages originated from other routers in a deterministic fashion.

A set of rules is applied in order to validate received source-active messages, and the first rule that applies determines the peer-RPF neighbor. All source-active messages from other routers are rejected. The rules applied to source-active messages originating at Router S received at Router R from Router N are as follows:

- If Router N and router S are one and the same, then the message is originated by a direct peer-RPF neighbor and will be accepted.
- If Router N is a configured peer, or a member of the Router R mesh group then its source-active messages are accepted.
- If Router N is the Border Gateway Protocol (BGP) next hop of the active multicast RPF route toward Router S then Router N is the peer-RPF neighbor and its source-active messages are accepted.
- If Router N is an external BGP peer of Router R and the last autonomous system (AS) number in the BGP AS-path to Router S is the same as Router N's AS number, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N uses the same next hop as the next hop to Router S, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N fits none of the above rules, then Router N is not a peer-RPF neighbor, and its source-active messages are rejected.

Default

No default peer is established and all active source messages must be RPF checked.

export

Syntax export *policy-name* [*policy-name*...(up to 5 max)]

no export

Context config>router>msdp

config>router>msdp>peer config>router>msdp>group config>router>msdp>group>peer

Description This command specifies the policies to export source active state from the source active list into Multicast

Source Discovery Protocol (MSDP).

Default No export policies are applied and all SA entries are announced.

Interactions: If multiple policy names are specified, the policies are evaluated in the order they are specified. The first

policy that matches is applied. If multiple export commands are issued, the last command entered will

override the previous command. A maximum of five policy names can be specified.

If you configure an export policy at the global level, each individual peer inherits the global policy. If you configure an export policy at the group level, each individual peer in a group inherits the group's policy. If you configure an export policy at the peer level then policy only applies to the peer where it is configured.

The **no** form of the command removes all policies from the configuration.

group

Syntax [no] group group-name

Context config>router>msdp

Description This command enables access to the context to create or modify a Multicast Source Discovery Protocol

(MSDP) group. To configure multiple MSDP groups, include multiple group statements.

By default, the group's options are inherited from the global MSDP options. To override these global

options, group-specific options within the group statement can be configured.

In order for a group to be of use at least one peer must be configured.

Default no group

Parameters group-name — Species a unique name for the MSDP group.

Interactions: If the group name provided is already configured then this command only provides the context to configure

the options pertaining to this group.

If the group name provided is not already configured, then the group name must be created and the context to configure the parameters pertaining to the group should be provided. In this case the \$ prompt to indicate

that a new entity (group) is being created should be used.

import

Syntax import policy-name [policy-name...(up to 5 max)]

no import

Context config>router>msdp

config>router>msdp>peer config>router>msdp>group config>router>msdp>group>peer

Description This command specifies the policies to import source active state from Multicast Source Discovery Protocol

(MSDP) into source active list.

Default No import policies are applied and all source active messages are allowed.

Interactions: If multiple policy names are specified, the policies are evaluated in the order they are specified. The first

policy that matches is applied. If multiple import commands are issued, the last command entered will

override the previous command. A maximum of five policy names can be specified.

The no form of the command removes all policies from the configuration.

If you configure an import policy at the global level, each individual peer inherits the global policy.

If you configure an import policy at the group level, each individual peer in a group inherits the groupís

policy.

If you configure an import policy at the peer level then policy only applies to the peer where it is configured.

local-address

Syntax local-address address

no local-address

Context config>router>msdp

config>router>msdp>peer config>router>msdp>group config>router>msdp>group>peer

Description This command configures the local end of a Multicast Source Discovery Protocol (MSDP) session. In order

for MSDP to function at least one peer must be configured. When configuring a peer, you must include this local-address command to configure the local end of the MSDP session. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote

peer.

The no local address format of this command removes the local-address from the configuration.

Default No local address is configured.

Parameters address — Specifies an existing address on the node.

Interactions: If the user enters this command then the address provided is validated and will be used as the local address

for MSDP peers from that point. If a subsequent local-address command is entered it will replace the

existing configuration and existing session(s) will be terminated.

Similarly when the no form of this command is entered the existing local-address will be removed from the

configuration and the existing session(s) will be terminated.

Whenever a session is terminated all information pertaining to and learned from that peer and will be

removed.

Whenever a new peering session is created or a peering session is lost an event message should be

generated.

mode

Syntax mode {mesh-group | standard}

Context config>router>msdp>group

Description This command configures groups of peers in a full mesh topology to limit excessive flooding of source-

active messages to neighboring peers.

Multicast Source Discovery Protocol (MSDP) peers can be configured grouped in a full-mesh topology that

prevents excessive flooding of source-active messages to neighboring peers.

Default standard (non-meshed)

Parameters mesh-group — Specifies that source-active message received from a mesh group member are always

accepted but are not flooded to other members of the same mesh group. These source-active messages

are only flooded to non-mesh group peers or members of other mesh groups.

standard — Specifies a non-meshed mode.

Interactions: In a meshed configuration all members of the group must have a peer connection with every other mesh

group member. If this rule is not adhered to then unpredictable results may occur.

peer

Syntax [no] peer peer-address

Context config>router>msdp

config>router>msdp>group

Description This command configures peer parameters. Multicast Source Discovery Protocol (MSDP) must have at least

one peer configured. A peer is defined by configuring a local-address that can be used by this node to set up a peering session and the address of a remote MSDP router, It is the address of this remote peer that is

configured in this command and it identifies the remote MSDP router address.

After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. It may be required to have multiple peering sessions in which case multiple peer statements should

be included in the configurations.

By default the options applied to a peer are inherited from the global or group-level. To override these

inherited options, include peer-specific options within the peer statement.

At least one peer must be configured for MSDP to function.

Default none

Parameters peer-address — The address configured in this statement must identify the remote MSDP router that the

peering session must be established with.

Interactions: If the peer address provided is already a configured peer then this command only provides the context to

configure the parameters pertaining to this peer.

If the peer address provided is not already a configured peer, then the peer instance must be created and the context to configure the parameters pertaining to this peer should be provided. In this case the \$ prompt to

indicate that a new entity (peer) is being created should be used.

The peer address provided will be validated and assuming it is valid it will be used as the remote address for an MSDP peering session. When the no form of this command is entered the existing peering address will be removed from the configuration and the existing session will be terminated. Whenever a session is terminated all source active information pertaining to and learned from that peer and will be removed.

Whenever a new peering session is created or a peering session is lost an event message should be

generated.

source

Syntax [no] source ip-prefix/mask

Context config>router>msdp

Description This command limits the number of active source messages the router accepts from sources in the specified

address range.

The **no** form of this message removes the source active rate limiter for this source address range.

Default

None. The source active msdp messages are not rate limited based on the source address range.

Interactions:

If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.

If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case the \$ prompt to indicate that a new entity (source) is being created should be used.

Parameters

ip-prefix — The IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

mask — The subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values 0 — 32 (mask length), 0.0.0.0 — 255.255.255.255 (dotted decimal)

Multicast CAC Policy Configuration Commands

mcac

Parameters mcac

Context config>router

config>router>pim>if

Description This command enables the context to configure multicast CAC parameters.

Default none

policy

Parameters [no] policy policy-name

Context config>router>mcac

config>router>pim>if>mcac

Description This command configures a multicast CAC (MCAC) policy name and enable the context for the policy

parameters.

A MCAC policy defines a policy that administers Connection Admission Control to limit the amount of bandwidth consumed by BTV. This bandwidth constraint can be on the second-mile link and/or on any network link. The multicast CAC function is applicable to any given interface for both IGMP and PIM, and in case of BTV distribution based on VPLS, and on VPLS SAPs / SDPs, where IGMP snooping is enabled.

A MCAC policy can contain one or more bundles of multicast groups (each representing a BTV channel). Constraints may be placed within a given bundle and/or a logical interface

The **no** form of the command removes a policy from the configuration. When the **no** form of the command is executed then all constraints previously placed by this policy on any multicast address are removed and multicast can potentially take up the full bandwidth of one or more interface.

When a new MCAC policy is created, policing of the policy must be in a gradual fashion. No active multicast groups can be removed. When a leave message is received for an optional channel then the multicast stream should be pruned and subsequent new joins can be denied in accordance with the policy.

Default none

Parameters policy-name — The MCAC policy statement name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

bundle

Parameters [no] bundle bundle-name

Context config>router>mcac>policy

Description This command creates the context that enables the grouping of MCAC group addresses into bundles.

When a number of multicast groups or BTV channels are grouped into a single bundle, then policing, if a join for a particular MC-group (BTV channel), can depend on whether:

- 1. There is enough physical bandwidth on the egress interface.
- 2. The given channel is a mandatory or optional channel.
- If optional, is there sufficient bandwidth according to the policy settings for the relevant interface.
- If optional, is there sufficient bandwidth within the bundle.

The **no** form of the command removes the named bundle from the configuration.

Default none

Parameters bundle-name — Specifies the multicast bundle name. Allowed values are any string up to 32 characters long

composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

bw bandwidth — Defines the bandwidth available to this bundle when unconstrained.

bandwidth

Syntax bandwidth bandwidth

no bandwidth

Context config>router>mcac>policy>bundle

Description This command configures the MCAC policy bundle maximum bandwidth.

Parameters bandwidth — Specifies the MCAC policy bandwidth.

channel

Parameters channel start-address end-address bw bandwidth [class {high | low}] [type {mandatory |

optional}]

no channel mc-ip-addr mc-ip-addr

Context config>router>mcac>policy>bundle

Description This command creates a MC group (range) as a channel within the bundle where it is configured. A join for

a particular MC group address (BTV channel) can be accepted depending on:

1) The channel is mandatory:

If there is sufficient bandwidth according to the policy settings for the interface. For bundle level, there is no need for a check since all the mandatory channels get bandwidth pre-reserved when created.

2) The channel is optional:

If there is sufficient bandwidth according to the policy settings for the interface.

If there is sufficient bandwidth inside the bundle.

When the multicast address is already specified in the same bundle then the new entry overwrites the old. If a multicast address is already specified in another bundle then this command will be rejected and an error message is generated.

If the bundle is removed, the policies associated are also removed and every multicast group that was previously policed (because it was in the bundle that contained the policy) becomes free of constraints.

When a new bundle policy is added to a MCAC policy then policing of the these new addresses must be in a gradual fashion. No active multicast groups can be removed. When a leave message is received for an optional channel then the multicast stream should be pruned and subsequent new joins can be denied in accordance to the policy.

It is possible that momentarily there may be insufficient bandwidth, even for mandatory channels, in this bundle.

Default none

Parameters

start-address end-address — Specifies the beginning and ending multicast IP addresses that identifies a multicast stream (BTV channel).

In a source-specific multicast (SSM) application, a source address preceded by a multicast address is used to identify a specific stream. If a source address is specified then the multicast address must be within the configured SSM address range.

bw bandwidth — Specifies the bandwidth required by this channel in kbps.

If this bandwidth is configured for a mandatory channel then this bandwidth is reserved by subtracting the amount from the total available bandwidth for all potential egress interfaces and the bundle.

If this bandwidth is configured as an optional channel then this bandwidth must be available for both the bundle and the egress interface requesting the channel to be added. Once the channel has been added the available bandwidth for the bundle and the interface must be reduced by the configured bandwidth of channel.

Values 10 — 20000 kbps

class {high | low} — Provides deeper classification of channels used in the algorithm when LAG ports change state.

Default low

type {mandatory | optional} — Specifies the channel to be either mandatory or optional.

- mandatory When the mandatory keyword is specified, then the bandwidth is reserved by subtracting it from the total available for all the potential egress interfaces and the bundle.
- optional When the optional keyword is specified then the bandwidth must be available on both
 the bundle and the egress interface that requests the channel to be added. Once the channel has been

added the available bandwidth for the bundle and the interface must be reduced by the configured bandwidth of channel.

Default optional

mc-ip-address *mc-ip-address* — Specifies the IP address that identifies a multicast stream (BTV channel). This must be a multicast address in the x.x.x.x format.

In the case of an SSM application, this means a source address preceded by a multicast address to identify a specific stream in the y.y.y.y/x.x.x.x format. If a source address is specified, then the multicast address must be within the configured SSM address range.

mc-constraints

Parameters mc-constraints

Context config>router>mcac>policy>bundle

Description This command enables the context to configure the level and its associated bandwidth for a bundle or a

logical interface.

Default none

lag-port-down

Parameters lag-port-down lag-id number-down number-lag-port-down level level-id

no lag-port-down lag-id number-down number-lag-port-down

Context config>router>mcac>policy>bundle>mc-constraints

Description This command configures the bandwidth available both at the interface and bundle level when a specific

number of ports in a LAG group fail.

Default none

Parameters lag-id — When the number of ports available in the LAG link is reduced by the number of ports configured

in this context then the *level-id* specified here must be applied.

number-down *number-lag-port-down* — If the number of ports available in the LAG is reduced by the number of ports configured in this command here then bandwidth allowed for bundle and/or interface

will be as per the levels configured in this context.

level *level-id* — Specifies the amount of bandwidth available within a given bundle for MC traffic for a specified level.

number-down

Parameters number-down number-lag-port-down level level-id

no number-down number-lag-port-down

Context config>router>pim>if>mcac>mc-constraints

Description This command configures the number of ports down along with level for multicast cac policy on this

interface.

Default none

Parameters number-down number-lag-port-down — If the number of ports available in the LAG is reduced by the

number of ports configured in this command here then bandwidth allowed for bundle and/or interface

will be as per the levels configured in this context.

level level-id — Specifies the amount of bandwidth available within a given bundle for MC traffic for a

specified level.

level

Parameters level level bw bandwidth

no level level

Context config>router>mcac>policy>bundle>mc-constraints

Description This command configures the amount of bandwidth available within a given bundle for MC traffic for a

specified level. The amount of allowable BW for the specified level is expressed in kbps and this can be

defined for up to eight different levels.

The **no** form of the command removes the level from the configuration.

Default none (If no bandwidth is defined for a given level then no limit is applied.)

Parameters level — Specifies the bandwidth for a given level. Level 1 has the highest priority. Level 8 has the lowest

priority.

Values 1-8

bw bandwidth — Specifies the bandwidth, in kbps, for the level.

Values 1 — 2147483647 kbps

Default 1

number-down

Syntax number-down number-lag-port-down level level-id

no number-down number-lag-port-down

Context config>router>igmp>mcac>mc-constraints

Description This command configures the number of ports down along with level for the MCAC policy.

Parameters number-lag-port-down — Specifies the number of ports down along with level for the MCAC policy.

Values 1 — 8

level level-id — Specifies the bandwidth for a given level. Level 1 has the highest priority. Level 8 has the

lowest priority.

Values 1-8

unconstrained-bw

Syntax unconstrained-bw bandwidth mandatory-bw mandatory-bw

no unconstrained-bw

Context config>router>igmp>interface>mcac

config>router>pim>interface>mcac

Description This command configures unconstrained bandwidth for the MCAC policy on this interface.

Parameters bandwidth — Specifies the unconstrained bandwidth for the MCAC policy.

Values 0 - 2147483647

mandatory-bw mandatory-bw — Specifies the mandatory bandwidth for the MCAC policy.

Values 0 — 2147483647

default-action

Parameters default-action {accept | discard}

Context config>router>mcac>policy

Description This command specifies the action to be applied to multicast streams (channels) when the streams do not

match any of the multicast addresses defined in the MCAC policy.

When multiple default-action commands are entered, the last command will overwrite the previous

command.

Default discard (all multicast stream not defined in a MCAC policy will be discarded)

Parameters accept — Specifies multicast streams (channels) not defined in the MCAC policy will be accepted.

discard — Specifies multicast streams (channels) not defined in the MCAC policy will be dropped.

shutdown

Parameters [no] shutdown

Context config>router>mcac>policy>bundle

Description This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no**

shutdown command.

When an entity is shutdown, the operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shutdown before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, shutdown and no shutdown are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

When a shutdown is performed then all constraints placed on either a bundle or an interface are removed and multicast can potentially take up the full bandwidth of the interface. Furthermore, when a **no shutdown** command is executed then policing of the policy must be in a gradual fashion. No active multicast groups may be removed. When a leave message is received for an optional channel then the multicast stream should be pruned and subsequent new joins can be denied in accordance with the policy. This may mean that for a period of time insufficient bandwidth is available even for mandatory channels.

MLD Commands

mld

Syntax [no] mld

Context config>router

Description This command enables the context to configure Multicast Listener Discovery (MLD) parameters.

The **no** form of the command disables MLD.

Default no mld

interface

Syntax [no] interface ip-int-name

Context config>router>mld

Description This command enables the context to configure an Multicast Listener Discovery (MLD) interface. The

interface is a local identifier of the network interface on which reception of the specified multicast address is

to be enabled or disabled.

The **no** form of the command deletes the MLD interface. The **shutdown** command in the **config>router>mld>interface** context can be used to disable an interface without removing the

configuration for the interface.

Default no interface — No interfaces are defined.

Parameters ip-int-name — The IP interface name. Interface names must be unique within the group of defined IP

interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will

be returned.

If the IP interface exists in a different area it will be moved to this area.

import

Syntax import policy-name

no import

Context config>router>mld>if

Configuration Commands

Description This command specifies the import route policy to be used for determining which membership reports are

accepted by the router. Route policies are configured in the **config>router>policy-options** context.

When an import policy is not specified, all the IGMP reports are accepted.

The **no** form of the command removes the policy association from the IGMP instance.

Default no import — No import policy specified.

Parameters policy-name — The route policy name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>pol-**

icy-options context.

max-groups

Syntax max-groups value

no max-groups

Context config>router>mld>if

Description This command specifies the maximum number of groups for which MLD can have local receiver

information based on received MLD reports on this interface. When this configuration is changed dynamically to a value lower than the currently accepted number of groups, the groups that are already

accepted are not deleted. Only new groups will not be allowed.

Default 0, no limit to the number of groups.

Parameters value — Specifies the maximum number of groups for this interface.

Values 1 — 16000

query-interval

Syntax query-interval seconds

no query-interval

Context config>router>mld

config>router>mld>if

Description This command specifies the frequency that the querier router transmits general host-query messages. The

host-query messages solicit group membership information and are sent to the all-systems multicast group

address, 224.0.0.1.

Default 125

Parameters seconds — The time frequency, in seconds, that the router transmits general host-query messages.

Values 2 — 1024

query-last-member-interval

Syntax query-last-member-interval seconds

Context config>router>mld

config>router>mld>if

Description This command configures the frequency at which the querier sends group-specific query messages including

messages sent in response to leave-group messages. The lower the interval, the faster the detection of the

loss of the last member of a group.

Default 1

Parameters seconds — Specifies the frequency, in seconds, at which query messages are sent.

Values 1 — 1024

query-response-interval

Syntax query-response-interval seconds

Context config>router>mld

config>router>mld>if

Description This command specifies how long the querier router waits to receive a response to a host-query message

from a host.

Default 10

Parameters seconds — Specifies the the length of time to wait to receive a response to the host-query message from the

host.

Values 1 — 1023

static

Syntax static

Context config>router>mld>if

Description This command tests multicast forwarding on an interface without a receiver host. When enabled, data is

forwarded to an interface without receiving membership reports from host members.

Default none

group

Syntax [no] group ipv6-address

Context config>router>mld>if>static

Description This command enables the context to add a static multicast group either as a (*,G) or one or more (S,G)

records. Use IGMP static group memberships to test multicast forwarding without a receiver host. When IGMP static groups are enabled, data is forwarded to an interface without receiving membership reports

from host members.

When static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP) are

configured, the static IGMP group entries do not generate join messages toward the RP.

The **no** form of the command removes the IPv6 address from the configuration.

Default none

Parameters ipv6-address — Specifies an IGMP multicast group address that receives data on an interface. The IP

address must be unique for each static group.

source

Syntax [no] source ipv6-address

Context config>router>mld>if>static>group

config>router>mld>ssm-translate>grp-range

Description This command specifies an IPv6 unicast address that sends data on an interface. This enables a multicast

receiver host to signal a router the group to receive multicast traffic from, and from the source(s) that the

traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The source command, in combination with the group, is used to create a specific (S,G) static group entry.

The **no** form of the command removes the source from the configuration.

Default none

Parameters *ip-address* — Specifies the IPv6 unicast address.

starg

Syntax [no] starg

Context config>router>mld>if>static>group

Description This command adds a static (*,G) entry. This command can only be enabled if no existing source addresses

for this group are specified.

Use the **no** form of the command to remove the starg entry from the configuration.

Default none

subnet-check

Syntax [no] subnet-check

Context config>router>mld>interface

Description This command enables subnet checking for MLD messages received on this interface. All MLD packets

with a source address that is not in the local subnet are dropped.

Default enabled

version

Syntax version version

no version

Context config>router>mld>if

Description This command specifies the MLD version. If routers run different versions, they will negotiate the lowest

common version of MLD that is supported by hosts on their subnet and operate in that version. For MLD to function correctly, all routers on a LAN should be configured to run the same version of MLD on that LAN.

Default 1

Parameters *version* — Specifies the MLD version number.

Values 1, 2

robust-count

Syntax robust-count robust-count

no robust-count

Context config>router>mld

Description This command configures the robust count. The robust-count variable allows tuning for the expected packet

loss on a subnet. If a subnet anticipates losses, the robust-count variable can be increased.

Default 2

Parameters *robust-count* — Specify the robust count value.

Values 2 — 10

ssm-translate

Syntax ssm-translate

Context config>router>mld

Description This command enables the context to configure group ranges which are translated to SSM (S,G) entries. If

the static entry needs to be created, it has to be translated from a IGMPv1 IGMPv2 request to a Source Specific Multicast (SSM) join. An SSM translate source can only be added if the starg command is not enabled. An error message is generated if you try to configure the **source** command with **starg** command

enabled.

grp-range

Syntax [no] grp-range start end

Context config>router>mld>ssm-translate

Description This command is used to configure group ranges which are translated to SSM (S,G) entries.

Parameters *start* — An IP address that specifies the start of the group range.

end — An IP address that specifies the end of the group range. This value should always be greater than or

equal to the value of the start value.

source

Syntax [no] source ip-address

Context config>router>mld>ssm-translate>grp-range

Description This command specifies the source IP address for the group range. Whenever a (*,G) report is received in

the range specified by grp-range start and end parameters, it is translated to an (S,G) report with the value

of this object as the source address.

Parameters *ip-address* — Specifies the IP address that will be sending data.

Operational Commands

mrinfo

Syntax mrinfo ip-address [router router-name|service]

Context <GLOBAL>

Description This command is used to display relevant multicast information from the target multicast router. Information

displayed includes adjacency information, protocol, metrics, thresholds, and flags from the target multicast router. This information can be used by network operators to determine whether bi-directional adjacencies

exist.

Parameters *ip-address* — Specify the IP address of the multicast capable target router should be entered.

router *router-name* — Specify the router instance that this command applies to.

Default management Base

service — Specify the service instance that this command applies to.

Values 1 — 2147483647

Mrinfo Output Fields — The following table describes the output fields:

Label	Description
General flags	
version	Indicates software version on queried router.
prune	Indicates that router understands pruning.
genid	Indicates that router sends generation IDs.
mtrace	Indicates that the router handles mtrace requests.
Neighbors flags	
1	Metric
0	Threshold (multicast time-to-live)
pim	PIM enabled on interface.
down	Operational status of interface.
disabled	Administrative status of interface.
leaf	No downstream neighbors on interface.
querier	Interface is IGMP querier.
tunnel	Neighbor reached via tunnel.

```
A:dut-f# mrinfo 10.1.1.2

```

mstat

Syntax mstat source ip-address group grp-ip-address [destination dst-ip-address] [hop hop] [router router-name|service] [wait-time wait-time]

reater name [service] [#

<GLOBAL>

Context Description

This command traces a multicast path from a source to a receiver and displays multicast packet rate and loss information. The **mstat** command adds the capability to show the multicast path in a limited graphic display and provide drops, duplicates, TTLs, and delays at each node. This information is useful to network operators because it identifies nodes with high drop and duplicate counts. Duplicate counts are shown as negative drops.

Parameters

source *ip-address* — Specify the IP address of the multicast-capable source. This is a unicast address of the beginning of the path to be traced.

group *group-ip-address* — Specify the multicast address that will be used.

destination *dst-ip-address* — Specify the IP address of the unicast destination. If this parameter is omitted, the IP address of the system where the command is entered is used. The destination parameter can also be used to specify a local interface address as the destination address to send the trace query.

Default The default address for the destination address is the incoming IETF format for that (S,G)

hop *hop* — Specify the maximum number of hops that will be traced from the receiver back toward the source.

Values 1 — 255

Default 32 hops (infinity for the DVMRP routing protocol).

router *router-name* — Specify the router instance that this command applies to.

service — Specify the service instance that this command applies to.

Values 1 — 2147483647

wait-time wait-time — Specify the number of seconds to wait for the response.

Values 1 — 60

Default 10

Mstat Output Fields — The following table describes the output fields:

Label	Description
hop	Number of hops from the source to the listed router.
router name	Name of the router for this hop or "?" when not reverse DNS translated.
address	Address of the router for this hop.
protocol	Protocol used.
ttl	Forward TTL threshold. TTL that a packet is required to have before it will be forwarded over the outgoing interface.
forwarding code	Forwarding information/error code for this hop.

For each interface between 2 nodes a line is printed, following the same layout as other routers with an implementation derived from mrouted. Note the following:

- The forwarding information/error code is only displayed when different from "No Error".
- "?" means the there is no reverse DNS translation.
- There is no "Overall Mcast Pkt Rate" available in the PE for the VPRN case.

Source	Response Dest	Overall	Packet Stat	istics For	Traffic From
10.10.16.9	10.20.1.6	Mcast Pkt	10.10.16.9	To 224.5.6	.7

Receiver	Query Source				

mtrace

Syntax mtrace source *ip-address* group *grp-ip-address* [destination *dst-ip-address*] [hop *hop*] [router router-name|service| [wait-time|

Context <GLOBAL>

Description

This command traces the multicast path from a source to a receiver by passing a trace query hop-by-hop along the reverse path from the receiver to the source. At each hop, information such as the hop address, routing error conditions, and packet statistics are gathered and returned to the requestor. A network administrator can determine where multicast flows stop and verify the flow of the multicast stream.

Parameters

source *ip-address* — Specify the IP address of the multicast-capable source. This is a unicast address of the beginning of the path to be traced.

group group-ip-address — Specify the multicast address that will be used.

destination *dst-ip-address* — Specify the IP address of the unicast destination. If this parameter is omitted, the IP address of the system where the command is entered is used. The destination parameter can also be used to specify a local interface address as the destination address to send the trace query.

Default The default address for the desination address is the incoming IETF format for that (S,G)

hop *hop* — Specify the maximum number of hops that will be traced from the receiver back toward the source.

Values 1 — 255

Default 32 hops (infinity for the DVMRP routing protocol).

router *router-name* — Specify the router instance that this command applies to.

service — Specify the service instance that this command applies to.

Values 1 — 2147483647

wait-time wait-time — Specify the number of seconds to wait for the response.

 $\begin{array}{ll} \text{Values} & 1 - 60 \\ \text{Default} & 10 \end{array}$

Mtrace Output Fields — The following table describes the output fields:

Round trip time 29 ms; total ttl of 5 required.

Label	Description			
hop	Number of hops from the source to the listed router.			
router name	Name of the router for this hop. If a DNS name query is not successful a "?" displays.			
address	Address of the router for this hop.			
protocol	Protocol used.			
ttl	Forward TTL threshold. TTL that a packet is required to have before it will be forwarded over the outgoing interface.			
forwarding code	Forwarding information/error code for this hop.			
A:Dut-F# mtrace source 10.10.16.9 group 224.5.6.7 Mtrace from 10.10.16.9 via group 224.5.6.7 Querying full reverse path

IGMP Commands

group

Syntax group [grp-ip-address]

group summary

Context show>router>igmp

Description This command displays the multicast group and (S,G) addresses. If no *grp-ip-address* parameters are

specified then all IGMP group, (*,G) and (S,G) addresses are displayed.

Parameters grp-ip-address — Displays specific multicast group addresses.

Output IGMP Group Output — The following table describes the output fields for IGMP group information.

Label	Description
IGMP Groups	Displays the IP multicast sources corresponding to the IP multicast groups which are statically configured.
Fwd List	Displays the list of interfaces in the forward list.
Blk List	Blk List

ssm-translate

Syntax ssm-translate

ssm-translate interface interface-name

Context show>router>igmp

Description This command displays IGMP SSM translate configuration information.

Output GMP Interface Output — The following table provides IGMP field descriptions.

Label	Description
Group Range	Displays the address ranges of the multicast groups for which this router can be an RP.
Source	Displays the unicast address that sends data on an interface.
SSM Translate Entries	Displays the total number of SSM translate entries.
Sample Output	

IGMP SSM Translate Entries					
Group Range	Source	Interface			
<234.1.1.1 - 234.1.1.2>	100.1.1.1	-			
<232.1.1.1 - 232.1.1.5>	100.1.1.2	ies-abc			

interface

Syntax interface [ip-int-name | ip-address] [group] [grp-address] [detail]

Context show>router>igmp

Description This command displays IGMP interface information.

Parameters *ip-int-name* — Only displays the information associated with the specified IP interface name.

ip-address — Only displays the information associated with the specified IP address.

group grp-address — Only displays IP multicast group address for which this entry contains information.

detail — Displays detailed IP interface information along with the source group information learned on that interface.

Output 10

IGMP Interface Output — The following table provides IGMP field descriptions.

Label	Description
Interface	Specifies the interfaces that participate in the IGMP protocol.
Adm Admin Status	Displays the administrative state for the IGMP protocol on this interface.
Oper Oper Status	Displays the current operational state of IGMP protocol on the interface.
Querier	Displays the address of the IGMP querier on the IP subnet to which the interface is attached.
Querier Up Time	Displays the time since the querier was last elected as querier.
Querier Expiry Timer	Displays the time remaining before the querier ages out. If the querier is the local interface address, the value will be zero.
Cfg/Opr Version Admin/Oper ver- sion	Cfg — The configured version of IGMP running on this interface. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN. Opr — The operational version of IGMP running on this interface. If the cfg value is 3 but all of the routers in the local subnet of this interface use IGMP version v1 or v2, the operational version will be v1 or v2.

Label	Description (Continued)
Num Groups	The number of multicast groups which have been learned by the router on the interface.
Policy	Specifies the policy that is to be applied on the interface.
Group Address	Specifies the IP multicast group address for which this entry contains information.
Up Time	Specifies the time since this source group entry got created.
Last Reporter	Specifies the IP address of the source of the last membership report received for this IP Multicast group address on this interface. If no membership report has been received, this object has the value 0.0.0.0.
Mode	The mode is based on the type of membership report(s) received on the interface for the group. In the 'include' mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report. In 'exclude' mode, reception of packets sent to the given multicast address is requested from all IP source addresses except those listed in the source-list parameter.
V1 Host Timer	The time remaining until the local router will assume that there are no longer any IGMP version 1 members on the IP subnet attached to this interface. Upon hearing any IGMPv1 Membership Report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv2 Leave messages for this group that it receives on this interface.
V2 Host Timer	The time remaining until the local router will assume that there are no longer any IGMP version 2 members on the IP subnet attached to this interface. Upon hearing any IGMPv2 Membership Report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv3 Leave messages for this group that it receives on this interface.
Туре	Indicates how this group entry was learned. If this group entry was learned by IGMP, it will be set to "dynamic". For statically configured groups, the value will be set to 'static'.
Compat Mode	Used in order for routers to be compatible with older version routers. IGMPv3 hosts MUST operate in version 1 and version 2 compatibility modes. IGMPv3 hosts MUST keep state per local interface regarding the compatibility mode of each attached network. A host's compatibility mode is determined from the Host Compatibility Mode variable which can be in one of three states: IGMPv1, IGMPv2 or IGMPv3. This variable is kept per interface and is dependent on the version of General Queries heard on that interface as well as the Older Version Querier Present timers for the interface.

static

Syntax static [ip-int-name | ip-addr]

Context show>router>igmp

Description This command displays static IGMP, (*,G) and (S,G) information.

Parameters *ip-int-name* — Only displays the information associated with the specified IP interface name.

ip-addr — Only displays the information associated with the specified IP address.

Output Static IGMP Output — The following table provides static IGMP field descriptions.

Label	Description
Source	Displays entries which represents a source address from which receivers are interested/not interested in receiving multicast traffic.
Group	Displays the IP multicast group address for which this entry contains information.
Interface	Displays the interface name.

Sample Output

*A:ALA-BA# show router 100 igmp static

IGMP Static Group Source

IGMP Static Group Source

Static (*,G)/(S,G) Entries : 3

statistics

Syntax statistics [ip-int-name | ip-address]

statistics host [ip-address]

Context show>router>igmp

Description This command displays IGMP statistics information.

Parameters *ip-int-name* — Only displays the information associated with the specified IP interface name.

ip-address — Only displays the information associated with the specified IP address.

Output IGMP Statistics Output — The following table provides statistical IGMP field descriptions.

Label	Description
IGMP Interface Statistics	The section listing the IGMP statistics for a particular interface.
Message Type	Queries — The number of IGMP general queries transmitted or received on this interface.
	Report — The total number of IGMP V1, V2, or V3 reports transmitted or received on this interface.
	$\label{leaves-leaves} \mbox{Leaves} - \mbox{The total number of IGMP leaves transmitted on this interface.}$
Received	Displays the total number of IGMP packets received on this interface.
Transmitted	Column that displays the total number of IGMP packets transmitted from this interface.
General Inter- face Statistics	The section listing the general IGMP statistics.
Bad Length	Displays the total number of IGMP packets with bad length received on this interface.
Bad Checksum	Displays the total number of IGMP packets with bad checksum received on this interface.
Unknown Type	Displays the total number of IGMP packets with unknown type received on this interface.
Bad Receive If	Displays the total number of IGMP packets incorrectly received on this interface.
Rx Non Local	Displays the total number of IGMP packets received from a non-local sender.
Rx Wrong Version	Displays the total number of IGMP packets with wrong versions received on this interface.
Policy Drops	Displays the total number of times IGMP protocol instance matched the host IP address or group/source addresses specified in the import policy.
No Router Alert	Displays the total number of IGMPv3 packets received on this interface which did not have the router alert flag set.

status

Syntax status

Context show>router>igmp

Description This command displays IGMP status information.

If IGMP is not enabled, the following message appears:

A:NYC# show router igmp status MINOR: CLI IGMP is not configured. A:NYC#

Output

IGMP Status Output — The following table provides IGMP status field descriptions.

Label	Description
Admin State	Displays the administrative status of IGMP.
Oper State	Displays the current operating state of this IGMP protocol instance on this router.
Query Interval	The frequency at which IGMP query packets are transmitted.
Last Member Query Interval	The maximum response time inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages.
Query Response Interval	The maximum query response time advertised in IGMPv2 queries.
Robust Count	Displays the number of times the router will retry a query.

Show Router PIM Commands

anycast

Syntax anycast [detail]

Context show>router>pim

Description This command displays PIM anycast rp-set information.

Parameters detail — Displays detailed information.

Output PIM anycast Output — The following table provides PIM anycast field descriptions

Label	Description		
Anycast Address	Displays the candidate anycast address.		
Anycast RP Peer	Displays the candidate anycast RP peer address.		

Sample Output

crp

Syntax crp [ip-address]

Context show>router>pim

Description Display PIM candidate RP (CRP) information received at the elected Bootstrap router (BSR).

Parameters *ip-address* — The candidate RP IP address.

Output PIM CRP Output — The following table provides PIM CRP field descriptions.

Label	Description
RP Address	Displays the Candidate RP address.
Group Address	Displays the range of multicast group addresses for which the CRP is the Candidate RP.
Priority	Displays the Candidate RP's priority for becoming a rendezvous point (RP). This value is used to elect RP for a group range. A value of 0 is considered as the highest priority.
Holdtime	Displays the hold time of the candidate RP. It is used by the Bootstrap router to time out the RP entries if it does not listen to another CRP advertisement within the holdtime period.
Expiry	The minimum time remaining before the CRP will be declared down. If the local router is not the BSR, this value is 0.
Candidate RPs	Displays the number of CRP entries.

s-pmsi

Syntax s-pmsi [mdSrcAddr [mdGrpAddr]] [detail]

Context show>router>pim

Description Displays the list of selective provider multicast service interfaces that are currently active.

Parameters mdSrcAddr — Specifies the source address of the multicast sender.

mdGrpAddr — Specifies the group address of the multicast sender.

detail — Displays detailed output.

Output **PIM data MDT Output** — The following table provides PIM data MDT descriptions.

Label	Description
MD Grp Address	Displays the IP multicast group address for which this entry contains information.
MD Src Address	Displays the source address of the multicast sender. It will be 0 if the type is configured as starg . It will be the address of the Rendezvous Point (RP) if the type is configured as starRP .
MT Index	Displays the index number.
Num VP SGs	Displays the VPN number.

Sample Output

*B:node-6# show router 100 pim s-pmsi ______

PIM Selective provider tunnels

group

Syntax group grp-ip-address [source ip-address [type {starstarrp | starg | sg}] [detail] [family]

Context show>router>pim

This command displays PIM source group database information.

grp-ip-address — Specifies the IP multicast group address for which this entry contains information.

source ip-address — Specifies the source address for which this entry contains information.

type starstarrp — Specifies that only (*, *, rp) entries be displayed.

type starg — Specifies that only (*,G) entries be displayed.

type sg — specifies that only (S,G) entries be displayed.

detail — Displays detailed group information.

family — Displays either IPv4 or IPv6 information.

Output

PIM Group Output — The following table provides PIM Group field descriptions.

Label	Description
Group Address	Displays the IP multicast group address for which this entry contains information.
Source Address	Displays the source address of the multicast sender. It will be 0 if the type is configured as starg. It will be the address of the Rendezvous Point (RP) if the type is configured as starRP.
RP Address	Displays the RP address.
Туре	Specifies the type of entry, $(*,*, rp)/(*,G)$ or (S,G) .
Spt Bit	Specifies whether to forward on $(*,*,rp)/(*,G)$ or on (S,G) state. It is updated when the (S,G) data comes on the RPF interface towards the source.
Incoming Intf	Displays the interface on which the traffic comes in. It can be the RPF interface to the RP (if starg) or the source (if sg).
Num Oifs	Displays the number of interfaces in the inherited outgoing interface list. An inherited list inherits the state from other types.
Flags	Displays the different lists that this interface belongs to.
Keepalive Timer Exp	The keepalive timer is applicable only for (S,G) entries. The (S,G) keepalive timer is updated by data being forwarded using this (S,G) Forwarding state. It is used to keep (S,G) state alive in the absence of explicit (S,G) joins.
MRIB Next Hop	Displays the next hop address towards the RP.
MRIB Src Flags	Displays the MRIB information about the source. If the entry is of type starg or starstarrp, it will contain information about the RP for the group.
Up Time	Displays the time since this source group entry was created.
Resolved By	Displays the route table used for RPF check.
Up JP State	Displays the upstream join prune state for this entry on the interface. PIM join prune messages are sent by the downstream routers towards the RPF neighbor.

Label	Description (Continued)
Up JP Expiry	Displays the minimum amount of time remaining before this entry will be aged out.
Up JP Rpt	Displays the join prune Rpt state for this entry on the interface. PIM join/prune messages are sent by the downstream routers towards the RPF neighbor. (S,G, rpt) state is a result of receiving (S,G, rpt) JP message from the downstream router on the RP tree.
Up JP Rpt Over- ride	Displays the value used to delay triggered Join (S,G, rpt) messages to prevent implosions of triggered messages. If this has a non-zero value, it means that the router was in 'notPruned' state and it saw a prune (S,G, rpt) message being sent to RPF (S,G, rpt). If the router sees a join (S,G, rpt) override message being sent by some other router on the LAN while the timer is still non-zero, it simply cancels the override timer. If it does not see a join (S,G, rpt) message, then on expiry of the override timer, it sends it's own join (S,G, rpt) message to RPF (S,G, rpt). A similar scenario exists when RPF (S,G, rpt) changes to become equal to RPF (*,G).
Register State	Specifies the register state. The register state is kept at the source DR. When the host starts sending multicast packets and if there are no entries programmed for that group, the source DR sends a register packet to the RP (g). Register state transition happen based on the register stop timer and the response received from the RP.
Register Stop Exp	Displays the time remaining before the register state might transition to a different state.
Register from Anycast RP	Displays if the register packet for that group has been received from one of the RP from the anycast-RP set.
RPF Neighbor	Displays the address of the RPF neighbor.
Outgoing Intf List	Displays a list of interfaces on which data is forwarded.
Curr Fwding Rate	Displays the current forwarding rate of the multicast data for this group and source.
Forwarded Pack- ets	Displays the number of multicast packets that were forwarded to the interfaces in the outgoing interface list.
Discarded Pack- ets	Displays the number of multicast packets that matched this source group entry but were discarded. For (S,G) entries, if the traffic is getting forwarded on the SPT, the packets arriving from the RPT will be discarded.
Forwarded Octets	Displays the number of octets forwarded.
RPF Mismatches	Displays the number of multicast packets that matched this source group entry but they did not arrive on the interface.

Label

Description (Continued)

Spt threshold

Displays the value of the SPT threshold configured for that group. 0 Kbps means that the switch to the SP tree will happen immediately.

interface

Syntax interface [ip-int-name | mt-int-name | ip-address] [group grp-ip-address | source ip-address [type

{starstarrp | starg | sg}] [detail] [family]

Context show>router>pim

Description This command displays PIM interface information and the (S,G)/(*,G)/(*,*,rp) state of the interface.

Parameters *ip-int-name* — Only displays the interface information associated with the specified IP interface name.

ip-address — Only displays the interface information associated with the specified IP address.

group grp-ip-address — Specifies the IP multicast group address for which this entry contains information.

source *ip-address* — Specifies the source address for which this entry contains information.

If the type is starg, the value of this object will be zero.

If the type is starstarrp, the value of this object will be address of the RP.

type — Specifies the type of this entry.

Values starstarrp, starg, sg

detail — Displays detailed interface information.

family — Displays IPv4 or IPv6 information for the interface.

Output PIM Interface Output — The following table provides PIM interface field descriptions.

Label	Description			
Admin State	Displays the administrative state for PIM protocol on this interface.			
Oper State	Displays the current operational state of PIM protocol on this interface.			
DR	Displays the designated router on this PIM interface.			
DR Priority	Displays the priority value sent in PIM Hello messages and that is used by routers to elect the designated router (DR).			
Hello Intvl	Indicates the frequency at which PIM Hello messages are transmitted on this interface.

neighbor

Syntax neighbor [ip-address | ip-int-name [address ip-address]] [detail] [family]

Context show>router>pim

Description This command displays PIM neighbor information.

This can be important if an interface has more than one adjacency. For example, a LAN-interface configuration with three routers connected and all are running PIM on their LAN interfaces. These routers then have two adjacencies on their LAN interface, each with different neighbors. If the **address** parameter is not defined in this example, then the **show** command output would display two adjacencies.

Parameters neighbor *ip-int-name* — Only displays the interface information associated with the specified IP interface

neighbor *ip-address* — Only displays the interface information associated with the specified IP address.

address ip-address — The ip-address of the neighbor, on the other side of the interface.

detail — Displays detailed neighbor information.

family — Displays either IPv4 or IPv6 information for the specified neighbor.

Output PIM Neighbor Output — The following table provides PIM neighbor field descriptions.

Label	Description
Interface	Displays the neighbor's interface name.
Nbr DR Priority	Displays the value of the neighbor's DR priority which is received in the hello message.
Nbr Address	Displays the neighbor's address.
Up Time	Displays the time since this PIM neighbor (last) became a neighbor of the local router.
Expiry Time	Displays the minimum time remaining before this PIM neighbor will be aged out. 0 — Means that this neighbor will never be aged out. This happens when the PIM neighbor sends a Hello message with holdtime set to 'Oxffff'.
Hold Time	Displays the value of the hold time present in the hello message.
DR Priority	Displays the value of the neighbor's DR priority which is received in the hello message.
Tracking Support	Displays whether the T bit in the LAN prune delay option was present in the hello message. This indicates the neighbor's capability to disable join message suppression.
LAN Delay	Displays the value of the LAN delay field present in the hello message received from the neighbor.

Label	Description (Continued)
Gen Id	Displays a randomly generated 32-bit value that is regenerated each time PIM forwarding is started or restarted on the interface, including when the router itself restarts. When a hello message with a new GenID is received from a neighbor, any old hello information about that neighbor is discarded and superseded by the information from the new hello message.
Override Intvl (ms)	Displays the value of the override interval present in the Hello message.

ALA-1#

rp

Syntax rp ip-address

Context show>router>pim

Description This command displays the rendezvous point (RP) set information built by the router.

Parameters *ip-address* — Specifies the IP address of the RP.

Output **PIM Neighbor Output** — The following table provides PIM neighbor field descriptions.

Label	Description
Group Address	Displays the multicast group address of the entry.
RP Address	Displays the address of the Rendezvous Point (RP).
Туре	Specifies whether the entry was learned through the Bootstrap mechanism or if it was statically configured.
Priority	Displays the priority for the specified group address. The higher the value, the higher the priority.
Holdtime	Displays the value of the hold time present in the BSM message.

Sample Output

A:ALA-1# show router pim rp _______ ______ Group Address RP Address Type Priority Holdtime ______ 224.0.0.0/4 200.200.200.4 Dynamic 192 150 10.1.7.1 Static 1 N/A Group Prefixes : 1 ______ A:ALA-1#

A:ALA-1#				

rp-hash

Syntax rp-hash grp-ip-address

Context show>router>pim

Description This command hashes the RP for the specified group from the RP set.

Parameters *grp-ip-address* — Displays specific multicast group addresses.

Output PIM RP-Hash Output — The following table provides RP-Hash output field descriptions.

Label	Description
Group Address	Displays the multicast group address of the entry.
RP Address	Displays the address of the Rendezvous Point (RP).
Туре	Specifies whether the entry was learned through the Bootstrap mechanism or if it was statically configured.

statistics

Syntax statistics [ip-int-name | mt-int-name | ip-address] [family]

Context show>router>pim

Description This command displays statistics for a particular PIM instance.

Parameters *ip-int-name* — Only displays the interface information associated with the specified IP interface name.

ip-address — Only displays the interface information associated with the specified IP address.

family — Displays either IPv4 or IPv6 information.

Output PIM Statistics Output — The following table provides PIM statistics output field descriptions.

Label	Description
PIM Statistics	The section listing the PIM statistics for a particular interface.
Message Type	Displays the type of message.
	Hello - Displays the number of PIM hello messages received or transmitted on this interface.
	Join Prune — Displays the number of PIM join prune messages received or transmitted on this interface.
	Asserts — Displays the number of PIM assert messages received or transmitted on this interface.
	Register — Displays the number of register messages received or transmitted on this interface.
	Null Register — Displays the number of PIM null register messages received or transmitted on this interface.
	Register Stop — Displays the number of PIM register stop messages received or transmitted on this interface.
	BSM — Displays the number of PIM Bootstrap messages (BSM) received or transmitted on this interface.
	Candidate $\ensuremath{\mathtt{RP}}$ $\ensuremath{\mathtt{Adv}}$ — Displays the number of candidate $\ensuremath{\mathtt{RP}}$ advertisements.
	Total Packets — Displays the total number of packets transmitted and received on this interface.
Received	Displays the number of messages received on this interface.
Transmitted	Displays the number of multicast data packets transmitted on this interface.
Rx Errors	Displays the total number of receive errors.

Label	Description (Continued)
General Inter- face Statistics	The section listing the general PIM interface statistics.
Register TTL Drop	Displays the number of multicast data packets which could not be encapsulated in Register messages because the time to live (TTL) was zero.
Tx Register MTU Drop	Displays the number of Bootstrap messages received on this interface but were dropped.
Rx Invalid Reg- ister	Displays the number of invalid PIM register messages received on this interface.
Rx Neighbor Unknown	Displays the number of PIM messages (other than hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
Rx Bad Checksum Discard	Displays the number of PIM messages received on this interface which were discarded because of bad checksum.
Rx Bad Encoding	Displays the number of PIM messages with bad encodings received on this interface.
Rx Bad Version Discard	Displays the number of PIM messages with bad versions received on this interface.
Rx CRP No Router Alert	Displays the number of candidate-rp advertisements (C-RP-Adv) received on this interface which had no router alert option set.
Rx Invalid Join Prune	Displays the number of invalid PIM join prune messages received on this interface.
Rx Unknown PDU Type	Displays the number of packets received with an unsupported PIM type.
Join Policy Drops	Displays the number of times the join policy match resulted in dropping PIM join-prune message or one of the source group contained in the message.
Register Policy Drops	Displays the number of times the register policy match resulted in dropping PIM register message.
Bootstrap Import Policy Drops	Displays the number of Bootstrap messages received on this interface but were dropped because of Bootstrap import policy.
Bootstrap Export Policy Drops	Displays the number of Bootstrap messages that were not transmitted on this interface because of Bootstrap export policy.
Source Group Statistics	The section listing the source group statistics.
(S,G)	Displays the number of entries in which the type is (S,G).

Label	Description (Continued)
(*,G)	Displays the number of entries in which the type is (*,G).
(*,*,RP)	Displays the number of entries in which the type is (*, *, rp).

status

Syntax status [detail] [family]

Context show>router>pim

Description

This command displays PIM status. The Oper Status reflects the combined operational status of IPv4/IPv6 PIM protocol status. If both are down, then Oper Status will be reflected as down. If IPv4 or IPv6 reflects up, the Oper Status will reflect up.

If PIM is not enabled, the following message appears:

A:NYC# show router pim status MINOR: CLI PIM is not configured. A:NYC#

Parameters

detail — Displays detailed statis information.

family — Displays either IPv4 or IPv6 information.

Output

PIM Status Output — The following table provides PIM status output field descriptions.

Label	Description
Admin State	Displays the administrative status of PIM.
Oper State	Displays the current operating state of this PIM protocol instance.
BSR State	Displays the state of the router with respect to the Bootstrap mechanism.
Address	Displays the address of the elected Bootstrap router.
Expiry Time	Displays the time remaining before the router sends the next Bootstrap message.
Priority	Displays the priority of the elected Bootstrap router. The higher the value, the higher the priority.
Hash Mask Length	Displays the hash mask length of the Bootstrap router.
Up Time	Displays the time since the current E-BSR became the Bootstrap router.

Label	Description (Continued)	
RPF Intf towards	Displays the RPF interface towards the elected BSR. The value is zero if there is no elected BSR in the network.	
Address	Displays the address of the candidate BSR router.	
Expiry Time	Displays the time remaining before the router sends the next Bootstrap message.	
Priority	Displays the priority of the Bootstrap router. The higher the value, the higher the priority.	
Hash Mask Length	Displays the hash mask length of the candidate Bootstrap router.	
Up Time	Displays the time since becoming the Bootstrap router.	
Admin State	Displays the administrative status of CRP.	
Oper State	Displays the current operating state of the C-RP mechanism.	
Address	Displays the local RP address.	
Priority	Displays the CRP's priority for becoming a rendezvous point (RP). A 0 value is the highest priority.	
Holdtime	Displays the hold time of the candidate RP. It is used by the Bootstra router to timeout the RP entries if it does not listen to another CRP advertisement within the holdtime period.	
Policy	Displays the PIM policies for a particular PIM instance.	
Default Group	Displays the default core group address.	
RPF Table	Displays the route table used for RPF check.	
MC-ECMP-Hashing	Displays if hash-based multicast balancing of traffic over ECMP links is enabled or disabled.

group

Syntax group [group-name] [detail]

Context show>router>msdp

Description This command displays information about MSDP groups.

Parameters group-name — Displays information about the specified group name. If no group-name is specified, information about all group names display.

detail — Displays detailed MSDP group infomration.

Output MSDP Group Output — The following table provides MSDP group field descriptions.

Label	Description	
Group Name	Displays the MSDP group name.	
Mode	Displays the groups of peers in a full mesh topology to limit excessive flooding of source-active messages to neighboring peers.	
Act Srcs	Displays the configured maximum number of active source messages that will be accepted by MSDP.	
Local Address	Displays the local end of a MSDP session.	
Admin State	Displays the administrative state.	
Receive Msg Rate	Displays rate that the messages are read from the TCP session.	
Receive Msg Time	Displays the time of MSDP messages that are read from the TCP session within the configured number of seconds.	
Receive Msg Thd	Displays the configured threshold number of MSDP messages can be processed before the MSDP message rate limiting function .	
SA Limit	Displays the source-active limit.

peer

Syntax peer [ip-address] [group group-name] [detail]

Context show>router>msdp

Description This command displays information about an MSDP peer.

Parameters *ip-address* — Displays information about the specified IP address. If no IP address specified, information about all MSDP IP addresses display.

group *group-name* — Displays information about the specified group name. If no *group-name* is specified, information about all MSDP peers display.

detail — Displays detailed MSDP peer infomration.

Output MSDP Peer Output — The following table provides MSDP field descriptions.

Label	Description	
Peer	Displays the IP address of the peer.	_
Local Address	Displays the local IP address.	
State	Displays the current state of the peer.	
Last State Change	Displays the date and time of the peer's last state change.	
SA Learn	The number of SAs learned through a peer.

source

Syntax source [ip-address/mask] [type {configured | dynamic | both}] [detail]

Context show>router>msdp

Description This command displays the discovery method for this multicast source.

Parameters configured — Displays user-created sources.

dynamic — Displays dynamically created sources.

both — Displays both user-configured and dynamically created sources.

detail — Displays detailed MSDP source information.

Output MSDP Source Output — The following table provides MSDP source field descriptions.

Source Displays the IP address of the peer.

Type Displays the type of peer.

SA limit Displays the local IP address.

State Displays the current state of the peer.

Num excd Indicates the number of times the global active source limit has been exceeded.

Last exceeded Displays the date and time of the peer's last state change.

source-active

Syntax source-active [group ip-address | local | originator ip-address | peer ip-address | source ip-

address |{group ip-address source ip-address}||detail|

Context show>router>msdp

Description This command displays source active messages accepted by MSDP.

Parameters

group *ip-address* — Displays information about the specified group IP address.

local — Displays information about local source-active messages.

originator *ip-address* — Displays information about the specified originator IP address.

peer *ip-address* — Displays information about the specified peer IP address.

source *ip-address* — Displays information about the specified source IP address.

group *ip-address* — Displays information about the specified group IP address.

detailDisplays detailed MSDP source-active information.

Output

MSDP Source-Active Output — The following table provides MSDP source-active field descriptions.

Label	Description
Grp Address	Displays the IP address of the group.
Src Address	Displays the IP address of the source.
Origin RP	Displays the origination rendezvous point (RP) address.
Peer Address	Displays the address of the peer.
State Timer	The time-out value. If the value reaches zero, the SA is removed.

Sample Output

A:ALA-48# show router msdp source-active

statistics

Syntax statistics [peer ip-address]

Context show>router>msdp

Description This command displays statistics information related to a MSDP peer.

Parameters peer *ip-address* — Displays information about the specified peer IP address

Output MSDP Statistics Output — The following table provides MSDP statistics field descriptions.

Label	Description
Last State Change	Displays the date and time the peer state changed.
RPF Failures	Displays the number of reverse path forwarding (RPF) failures.
SA Msgs Sent	Displays the number of source-active messages sent.
SA req. Msgs Sent	Displays the number of source-active request messages sent.
SA res. Msgs Sent	Displays the number of source-active response messages sent.

Label	Description (Continued)
KeepAlive Msgs Sent	Displays the number of keepalive messages sent.
Unknown Msgs Sent	Displays the number of unknown messages received.
Last message Peer	Displays the time the last message was received from the peer.
Remote Closes	Displays the number of times the remote peer close.
SA Msgs Recvd	Displays the number of source-active messages received.
SA req. Msgs Recvd	Displays the number of source-active request messages received.
SA res. Msgs Recvd	Displays the number of source-active response messages received.
KeepAlive Msgs Recd	Displays the number of keepalive messages received.
Error Msgs Recvd	Displays the number of unknown messages received.

Sample Output

status

Syntax status

Context show>router>msdp

Description This command displays MSDP status information.

Output MSDP Status Output — The following table provides MSDP status field descriptions.

Label	Description
Admin State	Displays the administrative state.
Local Address	Displays the local IP address.
Active Src Limit	Displays the active source limit.
Act Src Lim Excd	Displays the active source limit which has been exceeded.
Num. Peers	Displays the number of peers.
Num. Peers Estab	Displays the number of peers established.
Num. Source Active	Displays the number of active sources.
Policies	The policy to export source active state from the source active list into MSDP.
Data Encapsula- tion	The rendezvous point (RP) using MSDP to encapsulate multicast data received in MSDP register messages inside forwarded MSDP source-active messages - enabled or disabled.
Rate	The receive message rate.
Time	The receive message time.
Threshold	The number of MSDP messages that can be processed before the MSDP message rate limiting function is activated.
RPF Table	The name of the reverse path forwarding table.
Last mdsp Enabled	The time the last MDSP was triggered.

mcac

Syntax mcac

Context show>router

Description This command enables the context to display multicast CAC related information.

policy

Syntax policy [policy-name [bundle bundle-name] [protocol protocol-name] [interface if-name] [detail]]

Context show>router>mcac

Description This command displays MCAC policy information.

Parameters policy-name — Specifies an existing multicast CAC (MCAC) policy name.

bundle bundle-id — Specifies an existing multicast bundle name.

protocol protocol-name — specifies an applicable protocol to display.

Values igmp, pim, igmpSnpg

interface *if-name* — Specifies an interface name to display.

detail — Displays detailed information.

*A:ALA-48>show>router>mcac# policy			
Multicast CAC Policies			
Policy	Description

*A:ALA-48>show>router>mcac# policy btv_fr			

Multicast CAC policy

Policy : btv_fr
Description : foreign TV offering

Default Action : discard Bundle(s) : FOR

statistics

Syntax statistics policy policy-name [bundle bundle-name] [protocol protocol-name] [interface if-

name] statistics

Context show>router>mcac

Description This command displays MCAC statistics.

Parameters policy-name — Specifies an existing multicast CAC (MCAC) policy name.

bundle bundle-id — Displays statistics for the specified existing multicast bundle name.

protocol protocol-name — Displays statistics for the specified applicable protocol.

Values igmp, pim, igmpSnpg

interface *if-name* — Displays statistics for the specified interface name.

detail — Displays detailed information.

mvpn

Syntax mvpn

Context show>router router-instance

Description This command displays Multicast VPN related information. The router instance must be specified.

Sample Output

*A:Dut-C# show router 1 mvpn

MVPN 1 configuration data ______

signaling : Bgp auto-discovery : Enabled UMH Selection : Highest-Ip intersite-shared : Enabled vrf-import : N/A vrf-export : N/A vrf-target : target:1:1

Clear Commands

database

Syntax database [interface ip-int-name|ip-address] group grp-ip-address [source src-ip-address]

database grp-interface interface-name [fwd-service service-id]

database [interface ip-int-name|ip-address] group grp-ip-address source src-ip-address

database host [ip-address]

database interface ip-int-name|ip-address [group grp-ip-address] [source src-ip-address]

Context clear>router>igmp

Description This command clears IGMP or PIM database statistics on a specified interface or IP address.

Parameters interface *ip-int-name* — Clears the IGMP or PIM database on the specified interface.

interface *ip-address* — Clears the IGMP or PIM database on the specified IP address.

 $\textbf{group} \textit{group-ip-address} \ -\!\!\!\!- \text{Clears the multicast group address} (ipv4/ipv6) \ \text{or zero in the specified address}$

group.

source *ip-address* — Clears the IGMP or PIM database from the specified source IP address.

database

Syntax database [interface ip-int-name|mt-int-name|int-ip-address] [group grp-ip-address [source ip-

address]] [family]

Context clear>router>pim

Description This command clears IGMP or PIM database statistics on a specified interface or IP address.

Parameters interface *ip-int-name* — Clears the IGMP or PIM database on the specified interface.

interface *mt-int-name* — Clears the default core group address of the Multicast Distribution Tree (MDT) for the VPRN instance. The Multicast Tunnel (MT) interface for a VPRN is created when this object is set to a valid group address.

Syntax: *vprn-id*-mt-*grp-ip-address*

interface *ip-address* — Clears the IGMP or PIM database on the specified IP address.

group *group-ip-address* — Clears the multicast group address(ipv4/ipv6) or zero in the specified address group.

source ip-address — Clears the IGMP or PIM database from the specified source IP address.

family — Clears either IPv4 or IPv6 information.

mpls-if-name — Clears the MPLS interface name.

Syntax: mpls-if-index

statistics

Syntax statistics [**interface** *ip-int-name* | *ip-address*]

Context clear>router>igmp

Description This command clears IGMP statistics on a specified interface or IP address.

Note that interface and group/source cannot be specified at the same time.

Parameters interface *ip-int-name* — Clears IGMP statistics on the specified interface.

interface ip-address — Clears IGMP statistics on the specified IP address.

interface mt-int-name — Clears the default core group address of the Multicast Distribution Tree (MDT) for the VPRN instance. The Multicast Tunnel (MT) interface for a VPRN is created when this object is

set to a valid group address.

Syntax: *vprn-id*-mt-*grp-ip-address*

s-pmsi

Syntax s-pmsi [mdSrcAddr] [mdGrpAddr] [vprnSrcAddr vprnGrpAddr]

Context clear>router>pim

Description This command clears PIM selective provider multicast service interface cache.

Parameters *mdSrcAddr* — Clears the specified source address used for Multicast Distribution Tree (MDT).

mdGrpAddr — Clears the specified group address used for Multicast Distribution Tree (MDT).

vprnSrcAddr — Clears the specified source address of the multicast sender.

vprnGrpAddr — Clears the specified multicast group address.

statistics

Syntax statistics [{[interface ip-int-name | ip-address | mt-int-name]} {[group grp-ip-address [source ip-

address]]}] [family]]

Context clear>router>pim

Description This command clears PIM statistics on a specified interface or IP address.

Note that an interface and group or source cannot be specified at the same time.

Parameters interface *ip-int-name* — Clears PIM statistics on the specified interface.

interface *ip-address* — Clears PIM statistics on the specified IP address.

interface *mt-int-name* — Clears the default core group address of the Multicast Distribution Tree (MDT) for the VPRN instance. The Multicast Tunnel (MT) interface for a VPRN is created when this object is set to a valid group address.

syntax: vprn-id-mt-grp-ip-address

group *grp-ip-address* — When only the group address is specified and no source is specified, (*,G) statistics are cleared. When the group address is specified along with the source address, then the (S,G) statistics are reset to zero.

source *ip-address* — When the source address is specified along with the group address, then the (S,G) statistics are reset to zero.

family — Clears either IPv4 or IPv6 information.

version

Syntax version [interface ip-int-name | ip-address]

Context clear>router>igmp

Description This command clears IGMP statistics on a specified interface or IP address.

Parameters interface *ip-int-name* — Clears IGMP or PIM statistics on the specified interface.

interface ip-address — Clears IGMP or PIM statistics on the specified IP address.

mld

Syntax mld

Context clear>router

Description This command enables the context to to clear and reset Multicast Listener Discovery (MLD) entities.

database

Syntax database [interface ip-int-name|ipv6-address] [group ip-address [source ip-address]]

Context clear>router>mld

Description This command clears Multicast Listener Discovery (MLD) database parameters.

Parameters interface *ip-int-name* — Clears database information for the specified Multicast Listener Discovery

(MLD) interface name.

interface *ipv6-address* — Clears database information for the specified Multicast Listener Discovery (MLD) interface IPv6 address.

group *ip-address* — Clears database information for the specified Multicast Listener Discovery (MLD) group IP address.

source *ip-address* — Clears database information for the specified Multicast Listener Discovery (MLD) source IP address.

statistics

Syntax statistics [ip-int-name|ipv6-address]

Context clear>router>mld

Description This command clears Multicast Listener Discovery (MLD) statistics parameters.

Parameters *ip-int-name* — Clears statistics for the specified Multicast Listener Discovery (MLD) interface name.

ipv6-address — Clears statistics for the specified Multicast Listener Discovery (MLD) IPv6 address.

version

Syntax version [ip-int-name|ip-address]

Context clear>router>mld

Description This command clears Multicast Listener Discovery (MLD) version parameters.

Parameters ip-int-name — Clears version information for the specified Multicast Listener Discovery (MLD) interface

name.

ip-address — Clears version information for the specified Multicast Listener Discovery (MLD) IP address.

msdp

Syntax msdp

Context clear>router

Description This command enables the context to clear and reset Multicast Source Discovery protocol (MSDP) entities

and statistics.

cache

Syntax cache [peer ip-address] [group ip-address] [source ip-address] [originrp ip-address]

Context clear>router>msdp

Description This command clears the MSDP cache.

Clear Commands

Parameters peer *ip-address* — Clears the cache of the IP address of the peer to which Multicast Source Discovery

protocol (MSDP) source-active (SA) requests for groups matching this entry's group range were sent.

group *ip-address* — Clears the group IP address of the SA entry.

source *ip-address* — Clears the source IP address of the SA entry.

originrp ip-address — Clears the origin rendezvous point(RP) address type of the SA entry.

statistics

Syntax statistics [peer ip-address]

Context clear>router>msdp

Description peer *ip-address* — Clears the statistics of the IP address of the peer to which Multicast Source Discovery

Protocol (MSDP) source-active (SA) requests for groups matching this entry's group range were sent.

neighbor

Syntax neighbor [ip-int-name | ip-address] [family]

Context clear>router>pim

Description This command clears PIM neighbor data on a specified interface or IP address.

Parameters *ip-int-name* — Clears PIM neighbor on the specified interface.

ip-address — Clears PIM neighbor on the specified IP address.

family — Clears either IPv4 or IPv6 information.

igmp-snooping

Syntax igmp-snooping

Context clear>service>id

Description This command enables the context to clear IGMP snooping-related data.

port-db

Syntax port-db {sap sap-id | sdp sdp-id:vc-id} [group grp-address [source ip-address]]

Context clear>service>id>igmp-snooping

Description Clears the information on the IGMP snooping port database.

Parameters

sap sap-id — Clears IGMP snooping statistics matching the specified SAP ID and optional encapsulation value. The *sap-id* can be in one of the following formats:

Encapsulation ty	pe Syntax	Example
null	port-id	1/1/3
dot1q	port-id :qtag1	1/1/3:100
qinq	port-id :qtag1.qtag2	1/1/3:100.200

qtag1, qtag2 — The encapsulation value on the specified port ID.

Values 0 - 4094

sdp sdp-id — Clears only IGMP snooping entries associated with the specified mesh SDP or spoke SDP. For a spoke SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

Values 1 - 17407

vc-id — The virtual circuit ID on the SDP ID for which to clear information.

For mesh SDPs only, all VC IDs

Values 1 - 4294967295

group grp-address — Clears IGMP snooping statistics matching the specified group address.

source ip-address — Clears IGMP snooping statistics matching one particular source within the multicast group.

querier

Syntax querier

Context clear>service>id>igmp-snooping

Description Clears information on the IGMP snooping queriers for the VPLS service.

statistics

statistics [sap sap-id | sdp sdp-id:vc-id] Syntax

Context clear>service>id>igmp-snooping

Description Clears IGMP snooping statistics for the VPLS service.

Parameters sap sap-id — Displays IGMP snooping statistics for a specific SAP. The sap-id can be in one of the

following formats:

Encapsulation ty	pe Syntax	Example
null	port-id	1/1/3
dot1q	port-id :qtag1	1/1/3:100
ging	port-id :qtag1.qtag2	1/1/3:100.200

qtag1, qtag2 — The encapsulation value on the specified port ID.

Values 0 - 4094

sdp sdp-id — Displays the IGMP snooping statistics for a specific spoke or mesh SDP.

Values 1 - 17407

vc-id — The virtual circuit ID on the SDP ID for which to display information.

For mesh SDPs only, all VC IDs

Values 1 — 4294967295

pim-snooping

Syntax pim-snooping

Context clear>service>id

Description This command

This command enables the context to clear PIM snooping information.

database

Syntax database [[sap sap-id | sdp sdp-id:vc-id] [group grp-ip-address] [source src-ip-address]]

Context clear>service>id>pim-snooping

Description This command clears PIM snooping source group database information.

Parameters sap sap-id — Clears PIM snooping SAP information.

sdp sdp-id — Clears PIM snooping entries associated with the specified SDP. For a spoke SDP, the VC ID

must be specified; for a mesh SDP, the VC ID is optional.

Values 1 - 17407

group grp-address — Clears PIM snooping information matching the specified group address.

source ip-address — Clears PIM snooping information matching one particular source within the multicast group.

neighbor

Syntax neighbor [ip-address | sap sap-id | sdp sdp-id:vc-id]

Context clear>service>id>pim-snooping

Description This comand clears PIM snooping neighbor information.

Parameters ip-address — **sap** *sap-id* — Clears PIM snooping SAP information.

sdp *sdp-id* — Clears PIM snooping entries associated with the specified SDP. For a spoke SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

Values 1 — 17407

statistics

Syntax statistics [sap sap-id | sdp sdp-id:vc-id]

Context clear>service>id>pim-snooping

Description This command cloears PIM snooping statistics for the specified SAP or SDP.

Parameters sap sap-id — Clears PIM snooping SAP information.

sdp *sdp-id* — Clears PIM snooping entries associated with the specified SDP. For a spoke SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

Values 1 — 17407

Debug Commands

Debug IGMP Commands

group-interface

Syntax [no] group-interface [fwd-service service-id] [ip-int-name]

Context debug>router>igmp

Description This command enables debugging for IGMP group-interface.

The **no** form of the command disables debugging.

host

Syntax host [ip-address]

host [fwd-service service-id] group-interface ip-int-name

no host [ip-address]

no host [fwd-service service-id] group-interface ip-int-name

Context debug>router>igmp

Description This command enables debugging for the IGMP host.

The no form of the command disables debugging.

interface

Syntax [no] interface [ip-int-name | ip-address]

Context debug>router>igmp

Description This command enables debugging for IGMP interfaces.

The **no** form of the command disables the IGMP interface debugging for the specifies interface name or IP

address.

Parameters *ip-int-name* — Only displays the information associated with the specified IP interface name.

ip-address — Only displays the information associated with the specified IP address.

mcs

Syntax mcs [ip-int-name]

no mcs

Context debug>router>igmp

Description This command enables debugging for IGMP multicast servers (MCS).

The **no** form of the command disables the IGMP interface debugging for the specifies interface name.

Parameters *ip-int-name* — Only displays the information associated with the specified IP interface name.

misc

Syntax [no] misc

Context debug>router>igmp

Description This command enables debugging for IGMP miscellaneous.

The **no** form of the command disables the debugging.

Sample Output

```
A:ALA-CA# debug router 100 igmp misc
*A:ALA-CA# show debug
debug
router "100"
igmp
misc
exit
exit
exit
*A:ALA-CA#
```

packet

Syntax packet [query|v1-report|v2-report|v3-report|v2-leave] host ip-address

packet [query|v1-report|v2-report|v3-report|v2-leave] [ip-int-name|ip-address] no packet [query|v1-report|v2-report|v3-report|v2-leave] [ip-int-name|ip-address] no packet [query|v1-report|v2-report|v3-report|v2-leave] host ip-address

Context debug>router>igmp

Description This command enables/disables debugging for IGMP packets.

Parameters query — Specifies to log the IGMP group- and source-specific queries transmitted and received on this

interface.

v1-report — Specifies to log IGMP V1 reports transmitted and received on this interface.

Debug Commands

v2-report — Specifies to log IGMP V2 reports transmitted and received on this interface.
v3-report — Specifies to log IGMP V3 reports transmitted and received on this interface.
v2-leave — Specifies to log the IGMP Leaves transmitted and received on this interface.
ip-int-name — Only displays the information associated with the specified IP interface name.
ip-address — Only displays the information associated with the specified IP address.

Debug PIM Commands

adjacency

Syntax [no] adjacency

Context debug>router>pim

Description This command enables/disables debugging for PIM adjacencies.

all

Syntax all [group grp-ip-address] [source ip-address] [detail]

no all

Context debug>router>pim

Description This command enables/disables debugging for all the PIM modules.

Parameters group *grp-ip-address* — Debugs information associated with all PIM modules.

Values IPv4 or IPv6 address

source *ip-address* — Debugs information associated with all PIM modules.

Values IPv4 or IPv6 address

detail — Debugs detailed information on all PIM modules.

assert

Syntax assert [group grp-ip-address] [source ip-address] [detail]

no assert

Context debug>router>pim

Description This command enables/disables debugging for PIM assert mechanism.

Parameters group grp-ip-address — Debugs information associated with the PIM assert mechanism.

Values multicast group address (ipv4/ipv6)

source *ip-address* — Debugs information associated with the PIM assert mechanism.

Values source address (ipv4/ipv6)

detail — Debugs detailed information on the PIM assert mechanism.

Debug Commands

bsr

Syntax bsr [detail]

no bsr

Context debug>router>pim

Description This command enables debugging for PIM Bootstrap mechanism.

The **no** form of the command disables debugging.

Parameters detail — Debugs detailed information on the PIM assert mechanism.

data

Syntax data [group grp-ip-address] [source ip-address] [detail]

no data

Context debug>router>pim

Description This command enables/disables debugging for PIM data exception.

Parameters group *grp-ip-address* — Debugs information associated with the specified data exception.

Values multicast group address (ipv4/ipv6)

source ip-address — Debugs information associated with the specified data exception.

Values source address (ipv4/ipv6)

detail — Debugs detailed IP data exception information.

db

Syntax db [group grp-ip-address] [source ip-address] [detail]

no db

Context debug>router>pim

Description This command enables/disables debugging for PIM database.

Parameters group *grp-ip-address* — Debugs information associated with the specified database.

Values multicast group address (ipv4/ipv6) or zero

source *ip-address* — Debugs information associated with the specified database.

Values source address (ipv4/ipv6)

detail — Debugs detailed IP database information.

interface

Syntax interface [ip-int-name | mt-int-name | ip-address] [detail]

no interface

Context debug>router>pim

Description This command enables/disables debugging for PIM interface.

Parameters *ip-int-name* — Debugs the information associated with the specified IP interface name.

Values IPv4 or IPv6 interface address

mt-int-address — Debugs the information associated with the specified VPRN ID and group address.

ip-address — Debugs the information associated with the specified IP address.

detail — Debugs detailed IP interface information.

jp

Syntax jp [group grp-ip-address] [source ip-address] [detail]

no jp

Context debug>router>pim

Description This command enables/disables debugging for PIM Join-Prune mechanism.

Parameters group grp-ip-address — Debugs information associated with the specified Join-Prune mechanism.

Values multicast group address (ipv4/ipv6) or zero

source *ip-address* — Debugs information associated with the specified Join-Prune mechanism.

Values source address (ipv4/ipv6)

detail — Debugs detailed Join-Prune mechanism information.

mrib

Syntax mrib [group grp-ip-address] [source ip-address] [detail]

no mrib

Context debug>router>pim

Description This command enables/disables debugging for PIM MRIB.

Parameters group *grp-ip-address* — Debugs information associated with the specified PIM MRIB.

Values multicast group address (ipv4/ipv6)

source *ip-address* — Debugs information associated with the specified PIM MRIB.

Values source address (ipv4/ipv6)

detail — Debugs detailed MRIB information.

msg

Syntax msg [detail]

no msg

Context debug>router>pim

Description This command enables/disables debugging for PIM messaging.

Parameters detail — Debugs detailed messaging information.

packet

Syntax packet [hello | register | register-stop | jp | bsr | assert | crp] [ip-int-name | ip-address]

no packet

Context debug>router>pim

Description This command enables/disables debugging for PIM packets.

Parameters hello | register | register-stop | jp | bsr | assert | crp — PIM packet types.

ip-int-name — Debugs the information associated with the specified IP interface name.

Values IPv4 or IPv6 interface address

ip-address — Debugs the information associated with the specified IP address of a particular packet type.

register

Syntax register [group grp-ip-address] [source ip-address] [detail]

no register

Context debug>router>pim

Description This command enables/disables debugging for PIM Register mechanism.

Parameters group *grp-ip-address* — Debugs information associated with the specified PIM register.

Values multicast group address (ipv4/ipv6)

source *ip-address* — Debugs information associated with the specified PIM register.

Values source address (ipv4/ipv6)

detail — Debugs detailed register information.

rtm

Syntax rtm [detail]

no rtm

Context debug>router>pim

Description This command enables/disables debugging for PIM RTM.

Parameters detail — Debugs detailed RTM information.

s-pmsi

Syntax s-pmsi [{vpnSrcAddr [vpnGrpAddr]} [mdSrcAddr]] [detail]

no s-pmsi

Context debug>router>pim

Description This command enables debugging for PIM selective provider multicast service interface.

The no form of the command disables the debugging.

Parameters *vpnSrcAddr* — Specifies the VPN source address.

vpnGrpAddr — Specifies the VPN group address

mdSrcAddr — Specifies the source address of the multicast sender.

detail — Displays detailed information for selective PMSI.

msdp

Syntax [no] msdp

Context debug>router

Description This command enables debugging for Multicast Source Discovery Protocol (MSDP).

The **no** form of the command disables MSDP debugging.

packet

Syntax packet [pkt-type] [peer ip-address]

Context debug>router>msdp

Description This command enables debugging for Multicast Source Discovery Protocol (MSDP) packets.

The **no** form of the command disables MSDP packet debugging.

Debug Commands

Parameters *pkt-type* — Debugs information associated with the specified packet type.

Values keep-alive, source-active, sa-request, sa-response

peer *ip-address* — Debugs information associated with the specified peer IP address.

pim

Syntax pim [grp-address]

no pim

Context debug>router>msdp

Description This command enables debugging for Multicast Source Discovery Protocol (MSDP) PIM.

The **no** form of the command disables MSDP PIM debugging.

Parameters grp-address — Debugs the IP multicast group address for which this entry contains information.

rtm

Syntax rtm [rp-address]

no rtm

Context debug>router>msdp

Description This command enables debugging for Multicast Source Discovery Protocol (MSDP) route table manager

(RTM).

The **no** form of the command disables MSDP RTM debugging.

Parameters rp-address — Debugs the IP multicast address for which this entry contains information.

sa-db

Syntax sa-db [group grpAddr] [source srcAddr] [rp rpAddr]

no sadb

Context debug>router>msdp

Description This command enables debugging for Multicast Source Discovery Protocol (MSDP) source-active requests.

The **no** form of the command disables the MSDP source-active database debugging.

Parameters group *grpAddr* — Debugs the IP address of the group.

source *srcAddr* — Debugs the source IP address.

rp *rpAddr* — Debugs the specified rendezvous point RP address.

In This Chapter

This chapter provides information about configuring Routing Information Protocol (RIP) parameters.

Topics in this chapter include:

- RIP Overview on page 228
 - → RIP Features on page 229
 - RIP Version Types on page 229
 - RIPv2 Authentication on page 229
 - Metrics on page 230
 - Timers on page 230
 - Import and Export Policies on page 230
 - RIP Packet Format on page 231
- RIP Configuration Process Overview on page 234
- Configuration Notes on page 235

RIP Overview

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) that uses a distance-vector algorithm to determine the best route to a destination, using hop count as the metric. In order for the protocol to provide complete information on routing, every router in the domain must participate in the protocol.

RIP is a routing protocol based on a distance vector (Bellman-Ford) algorithm, which advertises network reachability by advertising prefix/mask and the metric (also known as hop count or cost). RIP selects the route with the lowest metric as the best route. RIP differs from link-state database protocols, such as OSPF and IS-IS, in that RIP advertises reachability information directly and link-state-database-based protocols advertise topology information. Each node is responsible for calculating the reachability information from the topology.

7750 SR OS software supports RIPv1 and RIPv2. RIPv1, specified in RFC 1058, was written and implemented prior to the introduction of CIDR. It assumes the netmask information for non-local routes, based on the class the route belongs to:

- Class A 8 bit mask
- Class B 16 bit mask
- Class C 24 bit mask

RIPv2 was written after CIDR was developed and transmits netmask information with every route. Because of the support for CIDR routes and other enhancements in RIPv2 such as triggered updates, multicast advertisements, and authentication, most production networks use RIPv2. However, there are some older systems (hosts and routers) that only support RIPv1, especially when RIP is used simply to advertise default routing information.

RIP is supported on all IP interfaces, including both network and access interfaces.

RIP Features

RIP, a UDP-based protocol, updates its neighbors, and the neighbors update their neighbors, and so on. Each host that uses RIP has a routing process that sends and receives datagrams on UDP port number 520.

Each RIP router advertises all RIP routes periodically via RIP updates. Each update can contain a maximum of 25 route advertisements. This limit is imposed by RIP specifications. RIP can sometimes be configured to send as many as 255 routes per update. The formats of the RIPv1 and RIPv2 updates are slightly different and are shown below. Additionally, RIPv1 updates are sent to a broadcast address, RIPv2 updates can be either sent to a broadcast or multicast address (224.0.0.9). RIPv2 supports subnet masks, a feature that was not available in RIPv1.

A network address of 0.0.0.0 is considered a default route. A default route is used when it is not convenient to list every possible network in the RIP updates, and when one or more closely-connected gateways in the system are prepared to handle traffic to the networks that are not listed explicitly. These gateways create RIP entries for the address 0.0.0.0, as if it were a network to which they are connected.

RIP Version Types

7750 SR OS allows you to specify the RIP version that will be sent to RIP neighbors and RIP updates that will be accepted and processed. 7750 SR OSallows the following combinations:

- Send *only* RIPv1 or send *only* RIPv2 to either the broadcast or multicast address or send no messages.
 - The default sends RIPv2 formatted messages to the broadcast address.
- Receive only RIPv1, receive only RIPv2, or receive both RIPv1 and RIPv2, or receive none.

The default receives both.

RIPv2 Authentication

RIPv2 messages carry more information, which permit the use of a simple authentication mechanism to secure table updates. The 7750 SR OS implementation enables the use of a simple password (plain text) or message digest (MD5) authentication.

Metrics

By default, RIP advertises all RIP routes to each peer every 30 seconds. RIP uses a hop count metric to determine the distance between the packet's source and destination. The metric/cost values for a valid route is 1 through 15. A metric value of 16 (infinity) indicates that the route is no longer valid and should be removed from the router's routing table.

Each router along the path increments the hop count value by 1. When a router receives a routing update with new or different destination information, the metric increments by 1.

The maximum number of hops in a path is 15. If a router receives a routing update with a metric of 15 and contains a new or modified entry, increasing the metric value by 1 will cause the metric increment to 16 (infinity). Then, the destination is considered unreachable.

The 7750 SR OS implementation of RIP uses *split horizon* with *poison reverse* to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

Timers

RIP uses numerous timers to determine how often RIP updates are sent and how long routes are maintained.

- Update Times the interval between periodic routing updates.
- Timeout This timer is initialized when a route is established and any time an update message is received for the route. When this timer expires, the route is no longer valid. It is retained in the table for a short time, so that neighbors can be notified that the route has been dropped.
- Flush When the flush timer expires, the route is removed from the tables.

Import and Export Policies

Routing policies can control the content of the routing tables, the routes that are advertised and the best route to take to reach a destination. Import route policies determine which routes are accepted from RIP neighbors. Export route policies determine which routes are exported from the route table to RIP. By default, RIP does not export routes it has learned to its neighbors.

There are no default routing policies. A policy must be created explicitly and applied to a RIP import or export command.

RIP Packet Format

The RIP packet format is displayed in Figure 3:

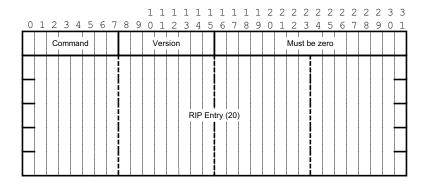

Figure 3: RIP Packet Format

A RIP packet consists of the following fields:

- Command Indicates whether the packet is a request or a response message. The
 request asks the responding system to send all or part of its routing table. The
 response may be sent in response to a request, or it may be an unsolicited routing
 update generated by the sender.
- Version The RIP version used. This field can signal different potentially incompatible versions.
- Must be zero Not used in RIPv1. This field provides backward compatibility with pre-standard varieties of RIP. The default value is zero.
- Address family identifier (AFI) The AFI is the type of address. RIP can carry routing information for several different protocols. Each entry in this field has an AFI to indicate the type of address being specified. The IP AFI is 2.
- Address The IP address for the packet.
- Metric Specifies the number of hops to the destination.
- Mask Specifies the IP address mask.
- Next hop Specifies the IP address of the next router along the path to the destination.

RIPv1 Format

There can be between 1 and 25 (inclusive) RIP entries. Figure 4 displays RIPv1 format:

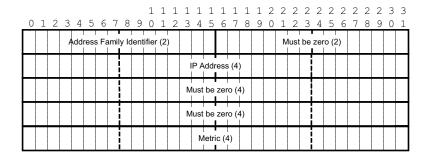

Figure 4: RIPv1 Format

RIPv2 Format

The RIP packet format is displayed in Figure 5:

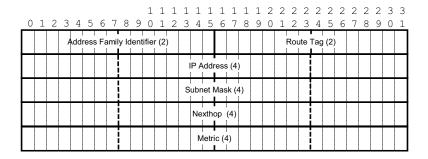

Figure 5: RIPv2 Format

The RIPv2 packets include the following fields:

- Subnet mask The subnet mask for the entry. If this field is zero, no subnet mask has been specified for the entry.
- Next hop —The IP address of the next hop to forward packets.

Hierarchical Levels

The minimum RIP configuration must define one group and one neighbor. The parameters configured on the global level are inherited by the group and neighbor levels. Parameters can be modified and overridden on a level-specific basis. RIP command hierarchy consists of three levels:

- Global
- Group
- Neighbor

Many of the hierarchical RIP commands can be modified on different levels. The most specific value is used. That is, a RIP group-specific command takes precedence over a global RIP command. A neighbor-specific statement takes precedence over a global RIP and group-specific command; for example, if you modify a RIP neighbor-level command default, the new value takes precedence over group- and global-level settings.

RIP Configuration Process Overview

Figure 6 displays the process to configure RIP parameters.

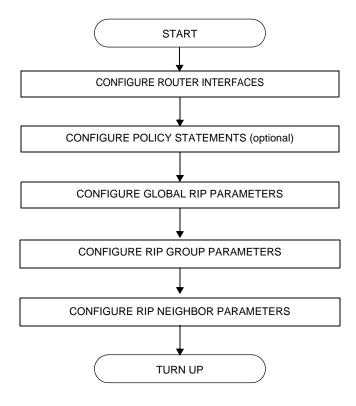

Figure 6: RIP Configuration and Implementation Flow

Configuration Notes

This section describes RIP configuration caveats.

General

- Before RIP neighbor parameters can be configured, router interfaces must be configured.
- RIP must be explicitly created for each router interface. There are no default RIP instances on a 7750 SR-Series router.

Configuration Notes

Configuring RIP with CLI

This section provides information to configure Routing Information Protocol (RIP) using the command line interface.

Topics in this section include:

- RIP Configuration Overview on page 238
- Basic RIP Configuration on page 239
- Common Configuration Tasks on page 240
 - → Configuring Interfaces on page 241
 - → Configuring a Route Policy on page 242
 - → Configuring RIP Parameters on page 244
 - → Configuring Global-Level Parameters on page 246
 - → Configuring Group-Level Parameters on page 247
 - → Configuring Neighbor-Level Parameters on page 248
- RIP Configuration Management Tasks on page 249
 - → Modifying RIP Parameters on page 249
 - → Deleting a Group on page 250
 - → Deleting a Neighbor on page 250

RIP Configuration Overview

Preconfiguration Requirements

Configure the following entities before beginning the RIP configuration:

• (Optional) Policy statements should be defined in the config>router>policy-options context.

RIP Hierarchy

RIP is configured in the config>router>rip context. RIP is not enabled by default. Three hierarchical levels are included in RIP configurations:

- Global
- Group
- Neighbor

Commands and parameters configured on the global level are inherited by the group and neighbor levels although parameters configured on the group and neighbor levels take precedence over global configurations.

Basic RIP Configuration

This section provides information to configure RIP and examples of common configuration tasks. For a router to accept RIP updates, in the config>router>rip context, you must define at least one group and one neighbor. A 7750 SR-Series router will ignore updates received from routers on interfaces not configured for RIP. Configuring other RIP commands and parameters are optional.

By default, the local router imports all routes from this neighbor and does not advertise routes. The router receives both RIPv1 and RIPv2 update messages with 25 to 255 route entries per message.

The RIP configuration commands have three primary configuration levels: rip for global configurations, group <code>group-name</code> for RIP group configurations, and <code>neighbor ip-int-name</code> for RIP neighbor configurations. Within the different levels, the configuration commands are identical. For the repeated commands, the command that is most specific to the neighboring router is in effect; that is, neighbor settings have precedence over group settings which have precedence over RIP global settings.

The minimal RIP parameters that need to be configured in the config>router>rip context are:

- Group
- Neighbor

The following example displays a basic RIP configuration.

```
ALA-A>config>router>rip# info

group "RIP-ALA-A"

neighbor "to-ALA-4"

exit

exit

ALA-A>config>router>rip#
```

Common Configuration Tasks

This section provides a brief overview of the tasks that must be performed to configure RIP and provides the CLI commands.

Configure RIP hierarchically using the global level (applies to all peers), the group level (applies to all peers in peer-group), or the neighbor level (only applies to the specified interface). By default, group members inherit the group's configuration parameters although a parameter can be modified on a per-member basis without affecting the group-level parameters.

Many of the hierarchical RIP commands can be used on different levels. The most specific value is used. That is, a RIP group-specific command takes precedence over a global RIP command. A neighbor-specific statement takes precedence over a global RIP or group-specific command.

All RIP instances must be explicitly created on each device. Once created, RIP is administratively enabled.

To configure RIP, perform the following tasks:

- 1. Configure interfaces
- 2. Configure policy statements (optional)
- 3. Enable RIP
- 4. Configure group parameters
- 5. Configure neighbor parameters

Configuring Interfaces

The following command sequences create a logical IP interface. The logical interface can associate attributes like an IP address, port, Link Aggregation Group (LAG), or the system. For more information about configuring interfaces, refer to the *IP Router Configuration Overview* chapter.

To configure a network interface:

The following example displays router interface configuration command usage:

```
Example: config>router> interface "to-ALA-4" config>router>if$ address 10.10.12.1/24 config>router>if# port 1/1/1 config>router>if# exit
```

The following example displays the IP configuration output showing the interface information.

Configuring a Route Policy

The import route policy command allows you to filter routes being imported by the local router from its neighbors. If no match is found, the local router does not import any routes.

The export route policy command allows you to determine which routes are exported from the route table to RIP. By default, RIP does not export routes it has learned to its neighbors. If no export policy is specified, non-RIP routes will not be exported from the routing table manager to RIP.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

This section only provides brief instructions to configure route policies. For more details, refer to the *Route Policy Overview* chapter.

To enter the mode to create or edit route policies, you must enter the begin keyword at the config>router>policy-options prompt. Other editing commands include:

- The commit command saves and enables changes made to route policies during a session.
- The abort command discards changes that have been made to route policies during a session.

Use the following CLI syntax to configure a policy to use for the RIP global, group, and neighbor import and export commands.

Use the following CLI syntax to enter the edit mode:

```
CLI Syntax: config>router> policy-options begin
```

The following example displays some commands to configure a policy statement. Policy option commands are configured in the config>router context. Use the commit command to save the changes.

```
ALA-A>config>router>policy-options# info

policy-statement "RIP-policy"
description "this is a test RIP policy"
entry 1
action accept
exit
exit
default-action reject
exit

ALA-A>config>router>policy-options>policy-statement#
```

Configuring RIP Parameters

Use the CLI syntax displayed below for:

- Configuring RIP Parameters on page 244
- Configuring Group-Level Parameters on page 247
- Configuring Neighbor-Level Parameters on page 248

```
CLI Syntax: config>router
            rip
               authentication-key [authentication-key | hash-key
               [hash|hash2]
               authentication-type {none | password|message-digest}
               check-zero {enable|disable}
               description string
               export policy-name [policy-name ...up to 5 max]
               import policy-name [policy-name ...up to 5 max]
               message-size number
               metric-in metric
               metric-out metric
               preference number
               receive {both|none|version-1|version-2}
               send {broadcast|multicast|none|version-1|both}
               no shutdown
               split-horizon {enable|disable}
               timers update timeout flush
               group group-name
                  authentication-key [authentication-key | hash-key
                  [hash|hash2]
                  authentication-type {none |password|message-digest}
                  check-zero {enable|disable}
                  description string
                  export policy-name [policy-name ...up to 5 max]]
                  import policy-name [policy-name ...up to 5 max]]
                  message-size number
                  metric-in metric
                  metric-out metric
                  preference number
                  receive {both|none|version-1|version-2}
                  send {broadcast|multicast|none|version-1}
                  no shutdown
                  split-horizon {enable|disable}
                  timers update timeout flush
                  neighbor ip-int-name
                     authentication-key [authentication-key | hash-key
```

```
[hash|hash2]
authentication-type {none|password|message-digest}
check-zero {enable|disable}
description string
export policy-name [policy-name ...up to 5 max]]
import policy-name [policy-name ...up to 5 max]]
message-size number
metric-in metric
metric-out metric
preference number
receive {both|none|version-1|version-2}
send {broadcast|multicast|none|version-1}
split-horizon {enable|disable}
timers update timeout flush
no shutdown
```

Configuring Global-Level Parameters

Once the RIP protocol instance is created, the no shutdown command is not required since RIP is administratively enabled upon creation. Minimally, to enable RIP on a router, at least one group and one neighbor must be configured. There are no default groups or neighbors. Each group and neighbor must be explicitly configured.

NOTE: Careful planning is essential to implement commands that can affect the behavior of global, group, and neighbor-levels. Because the RIP commands are hierarchical, analyze the values that can disable features on a particular level. Use the following CLI syntax to configure global-level RIP parameters:

```
CLI Syntax: config>router
               authentication-key [authentication-key|hash-key
               [hash|hash2]
               authentication-type {password|message-digest}
               check-zero {enable|disable}
               export policy-name [policy-name ...up to 5 max]
               import policy-name [policy-name ...up to 5 max]
               message-size number
               metric-in metric
               metric-out metric
               preference number
               receive {both|none|version-1|version-2}
               send {broadcast|multicast|none|version-1|both}
               no shutdown
               split-horizon {enable|disable}
               timers update timeout flush
```

The following example displays global RIP configuration command usage:

The following example displays the RIP group configuration:

Configuring Group-Level Parameters

A group is a collection of related RIP peers. The group name should be a descriptive name for the group. Follow your group, name, and ID naming conventions for consistency and to help when troubleshooting faults.

All parameters configured for a group are applied to the group and are inherited by each peer (neighbor), but a group parameter can be overridden on a specific neighbor-level basis. Use the following CLI syntax to configure a group:

```
CLI Syntax: config>router# rip
               group group-name
                  authentication-key[authentication-key|hash-key
                  [hash|hash2]
                  authentication-type {password|message-digest}
                  check-zero {enable|disable}
                  description string
                  export policy-name [policy-name ...]
                  import policy-name [policy-name ...]
                  message-size number
                  metric-in metric
                  metric-out metric
                  preference number
                  receive {both|none|version-1|version-2}
                     send {broadcast|multicast|none|version-1|both}
                     no shutdown
                     split-horizon {enable|disable}
                     timers update timeout flush
```

The following example displays group configuration command usage:

The following example displays the RIP group configuration:

```
ALA-A>config>router>rip# info

authentication-type simple
authentication-key "ac18651vz1d" hash
timers 300 600 600
group "headquarters"
description "Mt. View"
exit

ALA-A>config>router>rip#
```

Configuring Neighbor-Level Parameters

After you create a group name and assign options, add neighbor interfaces within the same group. All parameters configured for the peer group level are applied to each neighbor, but a group parameter can be overridden on a specific neighbor basis.

Use the following CLI syntax to add a neighbor to a group and define options that override the same group-level command value:

```
CLI Syntax: config>router# rip
            group group-name
                  neighbor ip-int-name
                     authentication-key [authentication-key | hash-key
                         [hash|hash2]
                     authentication-type {password|message-digest}
                     check-zero {enable|disable}
                     description string
                     export policy-name [policy-name ...]
                     import policy-name [policy-name ...]
                     message-size number
                     metric-in metric
                     metric-out metric
                     preference number
                     receive {both|none|version-1|version-2}
                     send {broadcast|multicast|none|version-1}
                     split-horizon {enable|disable}
                     timers update timeout flush
                     no shutdown
```

The following example displays neighbor configuration command usage:

The following example displays the neighbor configured in group "headquarters".

```
ALA-A>config>router>rip>group>neighbor# info

message-size 255
preference 255
split-horizon enable
no timers

ALA-A>config>router>rip>group>neighbor#
```

RIP Configuration Management Tasks

Examples are provided for the following RIP configuration management tasks:

- Modifying RIP Parameters on page 249
- Deleting a Group on page 250
- Deleting a Neighbor on page 250

Modifying RIP Parameters

Modify, add or remove RIP parameters in the CLI. The changes are applied immediately. For the complete list of CLI commands, refer to Configuring RIP Parameters on page 244.

```
CLI Syntax: config>router# rip
group group-name
...
neighbor ip-int-name
...

config>router>rip# group "headquarters"
config>router>rip>group# neighbor "ferguson-274"
config>router>rip>group>neighbor# import RIPpolicy
config>router>rip>group>neighbor# message-size 150
```

The following example displays the updated parameters:

Deleting a Group

A group must be shut down first in order to delete it.

Use the following CLI syntax to shut down and then delete a group:

If you try to delete the group without shutting it down first, the following message appears:

INFO: RIP #1204 group should be administratively down - virtual router index 1,group RIP-ALA-4

Deleting a Neighbor

The neighbor must be shut down before it can be deleted.

Use the following CLI syntax to delete a neighbor:

If you try to delete the neighbor before it is shut down, the following message appears:

INFO: RIP #1101 neighbor should be administratively down - virtual router index

Configuration Commands

```
config
       - router router-name
              — [no] rip
                       — authentication-key [authentication-key | hash-key] [hash | hash2]
                       - no authentication-key
                       — authentication-type {none | password | message-digest}
                       — no authentication-type
                       — check-zero {enable | disable}
                       — no check-zero
                       — description string
                       — no description
                       — export policy-name [policy-name ...(up to 5 max)]
                       — no export
                       — export-limit number [log percentage]
                       - no export-limit
                       — import policy-name [policy-name ...(up to 5 max)]
                       — no import
                       — message-size max-num-of-routes
                       — no message-size
                       — metric-in metric
                       - no metric-in
                       — metric-out metric
                       — no metric-out
                       — preference preference
                       — no preference
                       — receive receive-type
                       — no receive
                       — send send-type
                       — no send
                       - [no] shutdown
                       — split-horizon {enable | disable}
                       — no split-horizon
                       — timers update timeout flush
                       — no timers
```

Group Commands

```
config
     — router router-name
              — [no] rip
                       — [no] group group-name
                               — authentication-key [authentication-key | hash-key] [hash | hash2]
                               - no authentication-key
                               — authentication-type {none | password | message-digest}
                               — no authentication-type
                               — check-zero {enable | disable}
                               - no check-zero
                                — description description-string
                               — no description
                               — export policy-name [policy-name ...(up to 5 max)]
                               - no export
                               — import policy-name [policy-name ...(up to 5 max)]
                                — no import
                               — message-size max-num-of-routes
                               — no message-size
                               — metric-in metric
                               — no metric-in
                               — metric-out metric
                                - no metric-out
                                — preference preference
                               — no preference
                                — receive receive-type
                                — no receive
                               — send send-type
                                — no send
                               — [no] shutdown
                               — split-horizon {enable | disable}
                                — no split-horizon
                               — timers update timeout flush
                               - no timers
```

Neighbor Commands

```
config
     — router router-name
             — [no] rip
                      — [no] group group-name
                               — [no] neighbor ip-int-name
                                        — authentication-key [authentication-key | hash-key] [hash | hash2]
                                        — no authentication-key
                                        — authentication-type {none | password | message-digest}
                                        — no authentication-type
                                        — check-zero {enable | disable}
                                        - no check-zero
                                        — description description-string
                                        - no description
                                        — export policy-name [policy-name ...(up to 5 max)]
                                        - no export
                                        — import policy-name [policy-name ...(up to 5 max)]
                                        — no import
                                        — message-size max-num-of-routes
                                        - no message-size
                                        — metric-in metric
                                        - no metric-in
                                        — metric-out metric
                                        — no metric-out
                                        — preference preference
                                        — no preference
                                        — receive receive-type
                                        — no receive
                                        — send send-type
                                        — no send
                                        - [no] shutdown
                                        — split-horizon {enable | disable}
                                        - no split-horizon
                                        — timers update timeout flush
                                        — no timers
```

Show RIP Commands

```
show

— router

— rip

— database [ip-prefix [/mask] [longer] [peer ip-address] [detail]

— group [name] [detail]

— neighbors [ip-int-name | ip-addr] [detail] [advertised-routes]

— peer [interface-name]

— statistics [ip-int-name | ip-addr]
```

Clear RIP Commands

```
clear
— router
— rip
— database
— statistics [neighbor ip-int-name| ip-addrres]
```

Debug RIP Commands

```
debug

— router

— rip

— [no] auth [neighbor ip-int-name| ip-addrres]
— [no] error [neighbor ip-int-name| ip-addrres]
— [no] events [neighbor ip-int-name| ip-addrres]
— [no] holddown [neighbor ip-int-name| ip-addrres]
— [no] packets [neighbor ip-int-name| ip-addrres]
— [no] request [neighbor ip-int-name| ip-addrres]
— [no] trigger [neighbor ip-int-name| ip-addrres]
— [no] updates [neighbor ip-int-name| ip-addrres]
```

RIP Configuration Commands

Generic Commands

description

Syntax description string

no description

Context config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command creates a text description stored in the configuration file for a configuration context.

The description command associates a text string with a configuration context to help identify the context in

the configuration file.

The **no** form of the command removes any description string from the context.

Default no description — no description associated with the configuration context.

Parameters string — The description character string. Allowed values are any string up to 80 characters long composed

of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the

entire string must be enclosed within double quotes.

shutdown

Syntax [no] shutdown

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command administratively disables an entity. Downing an entity does not change, reset or remove any

configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the

operational state of the entity to down and the operational state of any entities contained within the

administratively down entity.

Unlike other commands and parameters where the default state will not be indicated in the configuration file,

shutdown and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

Special Cases RIP Global — In the config>router>rip context, the **shutdown** command administratively enables/disables

the RIP protocol instance. If RIP is globally shutdown, then all RIP group and neighbor interfaces transition to the operationally down state. Routes learned from a neighbor that is shutdown are immediately removed

from the RIP database and route table manager (RTM). A RIP protocol instance is administratively enabled by default.

RIP Group — In the config>router>rip>group *group-name* context, the **shutdown** command administratively enables/disables the RIP group. If a RIP group is shutdown, all member neighbor interfaces transition to the operationally down state. Routes learned from a neighbor that is shutdown are immediately removed from the RIP database and route table manager (RTM). A RIP group is administratively enabled by default.

RIP Neighbor — In the config>router>rip>group *group-name*>neighbor *ip-int-name* context, the **shutdown** command administratively enables/disables the RIP neighbor interface. If a RIP neighbor is shutdown, the neighbor interface transitions to the operationally down state. Routes learned from a neighbor that is shutdown are immediately removed from the RIP database and route table manager (RTM). A RIP neighbor interface is administratively enabled by default.

rip

Syntax [no] rip

Context config>router

Description This command creates the context to configure the RIP protocol instance.

When a RIP instance is created, the protocol is enabled by default. To start or suspend execution of the RIP

protocol without affecting the configuration, use the [no] shutdown command.

The **no** form of the command deletes the RIP protocol instance removing all associated configuration

parameters.

Default no rip — No RIP protocol instance defined.

authentication-key

Syntax authentication-key [authentication-key | hash-key] [hash | hash2]

no authentication-key

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command sets the authentication password to be passed between RIP neighbors.

The authentication type and authentication key must match exactly for the RIP message to be considered

authentic and processed.

The **no** form of the command removes the authentication password from the configuration and disables

authentication.

Default no authentication-key — No authentication key configured.

Parameters

authentication-key — The authentication key. Allowed values are any string up to 16 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

hash-key — The hash key. The key can be any combination of ASCII characters up to 33 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

authentication-type

Syntax authentication-type {none | password | message-digest}

no authentication-type

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command sets the type of authentication to be used between RIP neighbors.

The type and password must match exactly for the RIP message to be considered authentic and processed.

The **no** form of the command removes the authentication type from the configuration and effectively

disables authentication.

Default no authentication-type — No authentication enabled.

Parameters

none — The **none** parameter explicity disables authentication at a given level (global, group, neighbor). If the command does not exist in the configuration, the parameter is inherited.

password — Specify password to enable simple password (plain text) authentication. If authentication is enabled and no authentication type is specified in the command, simple **password** authentication is enabled.

message-digest — Configures message digest MD5 authentication in accordance with RFC1321. If this option is configured, then at least one message-digest-key must be configured

check-zero

Syntax check-zero {enable | disable}

no check-zero

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command enables checking for zero values in fields specified to be zero by the RIPv1 and RIPv2

specifications.

The check-zero enable command enables checking of the mandatory zero fields in the RIPv1 and RIPv2

specifications and rejecting non-compliant RIP messages.

The check-zero disable command disables this check and allows the receipt of RIP messages even if the

mandatory zero fields are non-zero.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no check-**

zero), the setting from the less specific level is inherited by the lower level.

The **no** form of the command removes the **check-zero** command from the configuration.

Special Cases RIP Global — By default, check-zero is disabled at the global RIP instance level.

Parameters enable — Specifies reject RIP messages which do not have zero in the RIPv1 and RIPv2 mandatory fields.

disable — Specifies allows receipt of RIP messages which do not have the mandatory zero fields reset.

export

Syntax export policy-name [policy-name ...up to 5 max]

no export

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command specifies the export route policies used to determine which routes are exported to RIP.

If no export policy is specified, non-RIP routes will not be exported from the routing table manager to RIP.

RIP-learned routes will be exported to RIP neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will

override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

Default no export — No export route policies specified.

Parameters

policy-name — The export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

export-limit

Syntax export-limit number [log percentage]

no export-limit

Context config>router>rip

Description This command configures the maximum number of routes (prefixes) that can be exported into RIP from the

route table.

The **no** form of the command removes the parameters from the configuration.

Default no export-limit, the export limit for routes or prefixes is disabled..

Parameters *number* — Specifies the maximum number of routes (prefixes) that can be exported into RIP from the route

table.

Values 1 — 4294967295

log percentage — Specifies the percentage of the export-limit, at which a warning log message and SNMP

notification would be sent.

Values 1 — 100

group

Syntax [no] group group-name

Context config>router>rip

Description This command creates a context for configuring a RIP group of neighbor interfaces.

RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration

for RIP interfaces.

The **no** form of the command deletes the RIP neighbor interface group. Deleting the group will also remove

the RIP configuration of all the neighbor interfaces currently assigned to this group.

Default no group — No group of RIP neighbor interfaces defined.

Parameters group-name — The RIP group name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire

string must be enclosed within double quotes.

RIP Configuration Commands

import

Syntax import policy-name [policy-name ...up to 5 max]

no import

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures import route policies to determine which routes are accepted from RIP neighbors.

If no import policy is specified, RIP accepts all routes from configured RIP neighbors. Import policies can be

used to limit or modify the routes accepted and their corresponding parameters and metrics.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple import commands are issued, the last command entered will

override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

Default no import — No import route policies specified.

Parameters policy-name — The import route policy name. Allowed values are any string up to 32 characters long

composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

message-size

Syntax message-size max-num-of-routes

no message-size

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures the maximum number of routes per RIP update message.

The **no** form of the command reverts to the default value.

Default message-size 25 — A maximum of 25 routes per RIP update message.

Parameters max-num-of-routes — The maximum number of RIP routes per RIP update message expressed as a decimal

integer.

Values 25 — 255

metric-in

Syntax metric-in metric

no metric-in

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures the metric added to routes received from a RIP neighbor.

When applying an export policy to a RIP configuration, the policy overrides the metric values determined

through calculations involving the **metric-in** and **metric-out** values.

The **no** form of the command reverts to the default value.

Default metric-in 1 — Add 1 to the metric of routes received from a RIP neighbor.

Parameters metric — The value added to the metric of routes received from a RIP neighbor expressed as a decimal

integer.

Values 1 — 16

metric-out

Syntax metric-out metric

no metric-out

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures the metric assigned to routes exported into RIP and advertised to RIP neighbors.

When applying an export policy to a RIP configuration, the policy overrides the metric values determined

through calculations involving the metric-in and metric-out values.

The **no** form of the command reverts to the default value.

Default metric-out 1 — Routes exported from non-RIP sources are given a metric of 1.

Parameters metric — The value added to the metric for routes exported into RIP and advertised to RIP neighbors

expressed as a decimal integer.

Values 1 — 16

neighbor

Syntax [no] neighbor ip-int-name

Context config>router>rip>group group-name

Description This command creates a context for configuring a RIP neighbor interface.

By default, interfaces are not activated in any interior gateway protocol, such as RIP, unless explicitly configured.

comigurea.

The **no** form of the command deletes the RIP interface configuration for this interface. The **shutdown** command in the config>router>rip>group *group-name*>neighbor *ip-int-name* context can be used to disable an interface without removing the configuration for the interface.

Default no neighbor — No RIP interfaces defined.

Parameters *ip-int-name* — The IP interface name. Interface names must be unique within the group of defined IP

interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured, an error message will

be returned.

preference

Syntax preference preference

no preference

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures the preference for RIP routes.

A route can be learned by the router from different protocols in which case the costs are not comparable.

When this occurs the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in Table 7. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the

config>router context.

The **no** form of the command reverts to the default value.

Default preference 100 — Preference of 100 for RIP routes.

Parameters

preference — The preference for RIP routes expressed as a decimal integer. Defaults for different route types are listed in Table 7.

Table 7: Route Preference Defaults by Route Type

Route Type	Preference	Configurable	
Direct attached	0	No	
Static routes	5	Yes	
OSPF internal	10	Yes	
IS-IS level 1 internal	15	Yes	
IS-IS level 2 internal	18	Yes	
RIP	100	Yes	
OSPF external	150	Yes	
IS-IS level 1 external	160	Yes	
IS-IS level 2 external	165	Yes	
BGP	170	Yes	
Values 0 — 255			

receive

Syntax receive {both | none | version-1 | version-2}

no receive

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures the type(s) of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accept packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior is to accept and process both RIPv1 and RIPv2 messages.

The **no** form of the command reverts to the default value.

Default receive both

Parameters both — Specifies that RIP updates in either version 1 or version 2 format will be accepted.

none — Specifies that RIP updates will not be accepted.

RIP Configuration Commands

version-1 — Specifies that RIP updates in version 1 format only will be accepted.version-2 — Specifies that RIP updates in version 2 format only will be accepted.

send

Syntax send {broadcast | multicast | none | version-1}

no send

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command specifies the type of RIP messages sent to RIP neighbors.

If version-1 is specified, the router need only listen for and accept packets sent to the broadcast address.

This control can be issued at the global, group or interface level.

The **no** form of the command reverts to the default value.

Default send broadcast — RIPv2 formatted messages will be sent to the broadcast address.

Parameters broadcast — Specifies send RIPv2 formatted messages to the broadcast address.

multicast — Specifies send RIPv2 formatted messages to the multicast address.

none — Specifies not to send any RIP messages (i.e. silent listener).

version-1 — Specifies send RIPv1 formatted messages to the broadcast address.

split-horizon

Syntax split-horizon {enable | disable}

no split-horizon

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the

specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

Default enabled

Parameters enable — Specifies enable split horizon and poison reverse.

disable — Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

timers

Syntax timers update timeout flush

no timers

Context config>router>rip

config>router>rip>group group-name

config>router>rip>group group-name>neighbor ip-int-name

Description This command configures values for the update, timeout and flush RIP timers.

The RIP update timer determines how often RIP updates are sent.

If the route is not updated by the time the RIP timeout timer expires, the route is declared invalid but is maintained in the RIP database.

The RIP flush timer determines how long a route is maintained in the RIP database after it has been declared invalid. Once the flush timer expires, the route is removed from the RIP database.

The **no** form of the command reverts to the default values.

Default timers 30 180 120 — RIP update timer set to 30 seconds, timeout timer to 180 seconds and flush timer to

120 seconds.

Parameters update — The RIP update timer value in seconds expressed as a decimal integer.

Values 1 — 600

timeout — The RIP timeout timer value in seconds expressed as a decimal integer.

Values 1 — 1200

flush — The RIP flush timer value in seconds expressed as a decimal integer.

Values 1 — 1200

RIP Configuration Commands

Show Commands

database

Syntax database [ip-prefix [/mask] [longer] [peer ip-address]

Context show>router>rip

Description This command displays the routes in the RIP database.

Output RIP Database Output — The following table describes the RIP route database output fields.

Label	Description
Destination	The RIP destination for the route.
Peer	The router ID of the peer router.
NextHop	The IP address of the next hop.
Metric	The hop count to rate the value of different hops.
Tag	The value to distinguish between internal routes (learned by RIP) and external routes (learned from other protocols).
TTL	Displays how many seconds the specific route will remain in the routing table. When an entry reaches 0, it is removed from the routing table.
Valid	No — The route is not valid.
	Yes - The route is valid.

Sample Output

A:ALA-A#	show	rip	database
----------	------	-----	----------

===========				======		======
RIP Route Database	е

No. of Routes: 10

2.27.2.24

group

Syntax group [group-name] [detail]

Context show>router>rip

Description Display RIP group information.

Parameters group-name — Displays RIP group information for the specified group.

detail — Displays detailed RIP group information.

Output Standard RIP Group Output — The following table describes the standard command output fields for a RIP group.

Label	Description
Group	The RIP group name.
Adm	Down - The RIP group is administratively down.
	Up - The RIP group is administratively up.
Opr	Down - The RIP group is operationally down.
	Up — The RIP group is operationally up.
Send Mode	Bcast - Specifies that RIPv2 formatted messages are sent to the broadcast address.
	Mcast - Specifies that RIPv2 formatted messages are sent to the multicast address.
	None - Specifies that no RIP messages are sent (i.e., silent listener)
	${\tt RIPv1}$ — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted.
	None - Specifies that RIP updates will not be accepted.
	RIPv1 — Specifies that RIP updates in version 1 format only will be accepted.
	RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.
Metric In	The metric value added to routes received from a RIP neighbor.

Sample Standard RIP Group Output

Sample Detailed Output

neighbors

Syntax neighbors [ip-addr | ip-int-name] [advertised-routes | detail]

Context show>router>rip

A:ALA-A#

Description Displays RIP neighbor interface information.

Parameters *ip-addr* | *ip-int-name* — Displays information for the specified IP interface.

Default all neighbor interfaces

advertised-routes — Displays the routes advertised to RIP neighbors. If no neighbors are specified, then all routes advertised to all neighbors are displayed. If a specific neighbor is given then only routes advertised to the given neighbor/interface are displayed.

Default display RIP information

Output

Standard RIP Neighbor Output — The following table describes the standard command output fields for a RIP group.

Table 8: RIP Neighbor Standard Output Fields

Label	Description
Neighbor	The RIP neighbor interface name.
Adm	Down - The RIP neighbor interface is administratively down.
	Up - The RIP neighbor interface is administratively up.
Opr	Down - The RIP neighbor interface is operationally down.
	Up - The RIP neighbor interface is operationally up.
Primary IP	The Primary IP address of the RIP neighbor interface.
Send Mode	Bcast - Specifies that RIPv2 formatted messages are sent to the broadcast address.
	${\tt Mcast-Specifies}$ that RIPv2 formatted messages are sent to the multicast address.
	None - Specifies that no RIP messages are sent (i.e., silent listener).
	RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted.
	None - Specifies that RIP updates will not be accepted.
	RIPv1 - Specifies that RIP updates in version 1 format only are accepted.
	RIPv2 - Specifies that RIP updates in version 2 format only are accepted.
Metric In	The metric added to routes received from a RIP neighbor.

Output

Detailed RIP Neighbor Output — The following table describes the standard command output fields for a RIP group.

Label	Description
Neighbor	The RIP neighbor name.
Description	The RIP neighbor description. No Description Available indicates no description is configured.
Primary IP	The RIP neighbor interface primary IP address.
Group	The RIP group name of the neighbor interface.
Admin State	Down - The RIP neighbor interface is administratively down.
	Up - The RIP neighbor interface is administratively up.
Oper State	Down - The RIP neighbor interface is operationally down.
	Up - The RIP neighbor interface is operationally up.
Send Mode	Bcast - Specifies that RIPv2 formatted messages are sent to the broadcast address.
	Mcast - Specifies that RIPv2 formatted messages are sent to the multicast address.
	None - Specifies that no RIP messages are sent (i.e., silent listener).
	RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted.
	None - Specifies that RIP updates will not be accepted.
	RIPv1 — Specifies that RIP updates in version 1 format only will be accepted.
	RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.
Metric In	The metric value added to routes received from a RIP neighbor.
Metric Out	The value added to routes exported into RIP and advertised to RIP neighbors.
Split Horizon	Disabled - Split horizon disabled for the neighbor.
	Enabled - Split horizon and poison reverse enabled for the neighbor.

Label	Description (Continued)
Check Zero	Disabled — Checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications are not checked allowing receipt of RIP messages even if mandatory zero fields are non-zero for the neighbor.
	Enabled — checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages is enabled for the neighbor.
Message Size	The maximum number of routes per RIP update message.
Preference	The preference of RIP routes from the neighbor.
Auth. Type	Specifies the authentication type.
Update Timer	The current setting of the RIP update timer value expressed in seconds.
Timeout Timer	The current RIP timeout timer value expressed in seconds.
Export Policies	The export route policy that is used to determine routes advertised to all peers.
Import Policies	The import route policy that is used to determine which routes are accepted from RIP neighbors.

peer

Syntax peer [ip-int-name]

Context show>router>rip

Description Displays RIP peer information.

Parameters *ip-int-name* — Dispays peer information for peers on the specified IP interface.

Default display peers for all interfaces

Output RIP Peer Output — The following table describes the command output fields for a RIP peer.

Label	Description
Peer IP Addr	The IP address of the peer router.
Interface Name	The peer interface name.
Version	The version of RIP running on the peer.
Last Update	The number of days since the last update.
No. of Peers	The number of RIP peers.

Sample Output

A:ALA-A# show router rip peers

RIP Peers

A:ALA-A#				

statistics

Output

Syntax statistics [ip-addr | ip-int-name]

Context show>router>rip

Description Display interface level statistics for the RIP protocol

If no IP address or interface name is specified, then all configured RIP interfaces are displayed.

If an IP address or interface name is specified, then only data regarding the specified RIP interface is displayed.

Parameters *ip-addr* | *ip-int-name* — Displays statistics for the specified IP interface.

RIP Statistics Output — The following table describes the output fields for RIP statistics.

Label	Description
Learned Routes	The number of RIP-learned routes were exported to RIP neighbors.
Timed Out Routes	The number of routes that have been timed out.
Current Memory	The amount of memory used by this RIP router instance.
Maximum Memory	The amount of memory allocated for this RIP router instance.
Interface	Displays the name of each interface configured in RIP and associated RIP statistics.
Primary IP	The interface IP address.
Update Timer	The current setting of the RIP update timer value expressed in seconds.
Timeout Timer	The current RIP timeout timer value expressed in seconds.
Flush Timer	The number of seconds after a route has been declared invalid that it is flushed from the route database.
Updates Sent	Total $-$ The total number of RIP updates that were sent.
	Last 5 Min — The number of RIP updates that were sent in the last 5 minutes.

Label	Description (Continued)
	Last 1 Min — The number of RIP updates that were sent in the last 1 minute.
Triggered Updates	Total — The total number of triggered updates sent. These updates are sent before the entire RIP routing table is sent.
	Last 5 \min — The number of triggered updates that were sent in the last 5 minutes.
	Last 1 \min — The number of triggered updates that were sent in the last 1 minute.
Bad Packets Received	Total — The total number of RIP updates received on this interface that were discarded as invalid.
	Last 5 Min $-$ The number of RIP updates received on this interface that were discarded as invalid in the last 5 minutes.
	Last 1 Min — The number of RIP updates received on this interface that were discarded as invalid in the last 1 minute.
RIPvl Updates Received	Total - The total number of RIPv1 updates received.
	Last 5 Min $-$ The number of RIPv1 updates received in the last 5 minutes.
	Last 1 \min — The number of RIPv1 updates received in the last 1 minute.
RIPv1 Updates Ignored	Total — The total number of RIPv1 updates ignored.
	Last 5 \min – The number of RIPv1 updates ignored in the last 5 minutes.
	Last 1 \min — The number of RIPv1 updates ignored in the last 1 minute.
RIPv1 Bad Routes	Total - The total number of bad routes received from the peer.
	Last 5 \min — The number of bad routes received from the peer in the last 5 minutes.
	Last 1 \min – The number of bad routes received from the peer in the last minute.
RIPv1 Requests Received	${\tt Total-The\ total\ number\ of\ times\ the\ router\ received\ RIPv1\ route}$ requests from other routers.
	Last 5 Min — The number of times the router received RIPv1 route requests from other routers in the last 5 minutes.

Label	Description (Continued)
	Last 1 Min — The number of times the router received RIPv1 route requests from other routers in the last 1 minute.
RIPv1 Requests Ignored	${\tt Total-The\ total\ number\ of\ times\ the\ router\ ignored\ RIPv1\ route}$ requests from other routers.
	Last 5 Min $-$ The number of times the router ignored RIPv1 route requests from other routers in the last 5 minutes.
	Last 1 Min $-$ The number of times the router ignored RIPv1 route requests from other routers in the last 1 minute.
RIPv2 Updates Received	Total - The total number of RIPv2 updates received.
	Last 5 \min — The number of RIPv2 updates received in the last 5 minutes.
	Last 1 \min – The number of RIPv2 updates received in the last minute.
RIPv2 Updates Ignored	Total — The total number of RIPv2 updates ignored.
	Last 5 Min $-$ The number of RIPv2 updates ignored in the last 5 minutes.
	Last 1 \min — The number of RIPv2 updates ignored in the last minute.
RIPv2 Bad Routes	Total $-$ The total number of RIPv2 bad routes received from the peer.
	Last 5 Min $-$ The number of RIPv2 bad routes received from the peer in the last 5 minutes.
	Last 1 \min — The number of RIPv2 bad routes received from the peer in the last minute.
RIPv2 Requests Received	${\tt Total-The\ total\ number\ of\ times\ the\ router\ received\ RIPv2\ route}$ requests from other routers.
	Last 5 Min $-$ The number of times the router received RIPv2 route requests from other routers in the last 5 minutes.
	Last 1 Min $-$ The number of times the router received RIPv2 route requests from other routers in the last minute.
RIPv2 Requests Ignored	${\tt Total}$ — The total number of times the router ignored RIPv2 route requests from other routers.
	Last 5 Min $-$ The number of times the router ignored RIPv2 route requests from other routers in the last 5 minutes.

•	_	ᆫ	_
_	а	n	e

Description (Continued)

Last 1 Min - The number of times the router ignored RIPv2 route requests from other routers in the last minute.

Authentication Errors

 \mathtt{Total} — The total number of authentication errors to secure table updates.

Last 5 Min - The number of authentication errors to secure table updates in the last 5 minutes.

Last 1 \min — The number of authentication errors to secure table updates in the last minute.

A:ALA-A#

Clear Commands

database

Syntax database

Context clear>router>rip

Description Flush all routes in the RIP database.

statistics

Syntax statistics [neighbor ip-int-name | ip-address]

Context clear>router>rip

Description Clears statistics for RIP neighbors.

Parameters neighbor *ip-int-name* | *ip-address* — Clears the statistics for the specified RIP interface.

Default clears statistics for all RIP interfaces

Debug RIP Commands

auth

Syntax [no] auth [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP authentication.

Parameters neighbor ip-addr | ip-int-name — Debugs the RIP authentication for the neighbor IP address or interface.

error

Syntax [no] error [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP errors.

Parameters neighbor *ip-addr* | *ip-int-name* — Debugs the RIP errors sent on the neighbor IP address or interface.

events

Syntax [no] events [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP events.

Parameters neighbor *ip-addr* | *ip-int-name* — Debugs the RIP events sent on the neighbor IP address or interface.

holddown

Syntax [no] holddown [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP holddowns.

Parameters neighbor *ip-addr* | *ip-int-name* — Debugs the RIP holddowns sent on the neighbor IP address or interface.

Debug RIP Commands

packets

Syntax [no] packets [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP packets.

Parameters neighbor ip-addr | ip-int-name — Debugs the RIP packets sent on the neighbor IP address or interface.

request

Syntax [no] request [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP requests.

Parameters neighbor ip-addr | ip-int-name — Debugs the RIP requests sent on the neighbor IP address or interface.

trigger

Syntax [no] trigger [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP trigger updates.

Parameters neighbor *ip-addr* | *ip-int-name* — Debugs the RIP updates sent on the neighbor IP address or interface.

updates

Syntax [no] updates [neighbor ip-int-name | ip-addr]

Context debug>router>rip

Description This command enables debugging for RIP updates.

Parameters neighbor ip-addr | ip-int-name — Debugs the RIP updates sent on the neighbor IP address or interface.

In This Chapter

This chapter provides information about configuring the Open Shortest Path First (OSPF) protocol.

Topics in this chapter include:

- Configuring OSPF on page 282
 - → OSPF Areas on page 283
 - Backbone Area on page 283
 - Stub Area on page 284
 - Not-So-Stubby Area on page 285
 - → OSPF Super Backbone on page 285
 - → Virtual Links on page 291
 - → Neighbors and Adjacencies on page 292
 - → Link-State Advertisements on page 293
 - → Metrics on page 293
 - → Authentication on page 294
 - → IP Subnets on page 295
 - → Preconfiguration Recommendations on page 295
- OSPF Configuration Process Overview on page 299
- Configuration Notes on page 300

Configuring OSPF

OSPF (Open Shortest Path First) is a hierarchical link state protocol. OSPF is an interior gateway protocol (IGP) used within large autonomous systems (ASs). OSPF routers exchange state, cost, and other relevant interface information with neighbors. The information exchange enables all participating routers to establish a network topology map. Each router applies the Dijkstra algorithm to calculate the shortest path to each destination in the network. The resulting OSPF forwarding table is submitted to the routing table manager to calculate the routing table.

When a router is started with OSPF configured, OSPF, along with the routing-protocol data structures, is initialized and waits for indications from lower-layer protocols that its interfaces are functional. Alcatel-Lucent's implementation of OSPF conforms to OSPF Version 2 specifications presented in RFC 2328, *OSPF Version 2* and OSPF Version 3 specifications presented in RFC 2740, *OSPF for IPv6*. Routers running OSPF can be enabled with minimal configuration. All default and command parameters can be modified.

Changes between OSPF for IPv4 and OSPF3 for IPv6 include the following:

- Addressing semantics have been removed from OSPF packets and the basic link-state advertisements (LSAs). New LSAs have been created to carry IPv6 addresses and prefixes.
- OSPF3 runs on a per-link basis, instead of on a per-IP-subnet basis.
- Flooding scope for LSAs has been generalized.
- Unlike OSPFv2, OSPFv3 authentication relies on IPV6's authentication header and encapsulating security payload.
- Most packets in OSPF for IPv6 are almost as compact as those in OSPF for IPv4, even with the larger IPv6 addresses.
- Most field and packet-size limitations present in OSPF for IPv4 have been relaxed.
- Option handling has been made more flexible.

Key OSPF features are:

- Backbone areas
- Stub areas
- Not-So-Stubby areas (NSSAs)
- Virtual links
- Authentication
- Route redistribution
- Routing interface parameters
- OSPF-TE extensions (Alcatel-Lucent's implementation allows MPLS fast reroute)

OSPF Areas

The hierarchical design of OSPF allows a collection of networks to be grouped into a logical area. An area's topology is concealed from the rest of the AS which significantly reduces OSPF protocol traffic. With the proper network design and area route aggregation, the size of the route-table can be drastically reduced which results in decreased OSPF route calculation time and topological database size.

Routing in the AS takes place on two levels, depending on whether the source and destination of a packet reside in the same area (intra-area routing) or different areas (inter-area routing). In intra-area routing, the packet is routed solely on information obtained within the area; no routing information obtained from outside the area is used.

Routers that belong to more than one area are called area border routers (ABRs). An ABR maintains a separate topological database for each area it is connected to. Every router that belongs to the same area has an identical topological database for that area.

Backbone Area

The OSPF backbone area, area 0.0.0.0, must be contiguous and all other areas must be connected to the backbone area. The backbone distributes routing information between areas. If it is not practical to connect an area to the backbone (see area 0.0.0.5 in Figure 7) then the ABRs (such as routers Y and Z) must be connected via a virtual link. The two ABRs form a point-to-point-like adjacency across the transit area (see area 0.0.0.4).

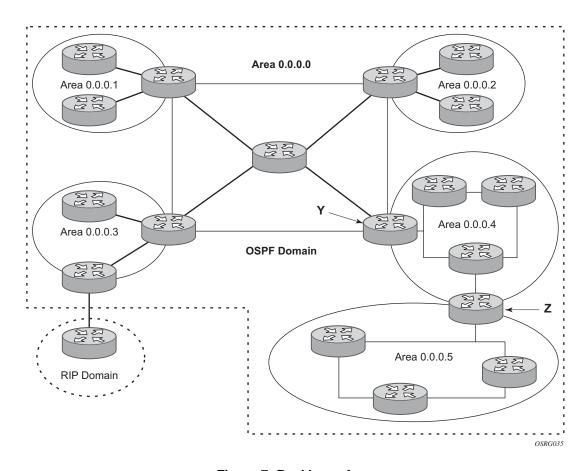

Figure 7: Backbone Area

Stub Area

A stub area is a designated area that does not allow external route advertisements. Routers in a stub area do not maintain external routes. A single default route to an ABR replaces all external routes. This OSPF implementation supports the optional summary route (type-3) advertisement suppression from other areas into a stub area. This feature further reduces topological database sizes and OSPF protocol traffic, memory usage, and CPU route calculation time.

In Figure 7, areas 0.0.0.1, 0.0.0.2 and 0.0.0.5 could be configured as stub areas. A stub area cannot be designated as the transit area of a virtual link and a stub area cannot contain an AS boundary router. An AS boundary router exchanges routing information with routers in other ASs.

Not-So-Stubby Area

Another OSPF area type is called a Not-So-Stubby area (NSSA). NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. External routes learned by OSPF routers in the NSSA area are advertised as type-7 LSAs within the NSSA area and are translated by ABRs into type-5 external route advertisements for distribution into other areas of the OSPF domain. An NSSA area cannot be designated as the transit area of a virtual link.

In Figure 7, area 0.0.0.3 could be configured as a NSSA area.

OSPF Super Backbone

The 77x0 PE routers have implemented a version of the BGP/OSPF interaction procedures as defined in RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*. Features included in this RFC includes:

- Loop prevention
- Handling LSAs received from the CE
- Sham links
- Managing VPN-IPv4 routes received by BGP

VPRN routes can be distributed among the PE routers by BGP. If the PE uses OSPF to distribute routes to the CE router, the standard procedures governing BGP/OSPF interactions causes routes from one site to be delivered to another in type 5 LSAs, as AS-external routes.

The MPLS VPN super backbone behaves like an additional layer of hierarchy in OSPF. The PErouters that connect the respective OSPF areas to the super backbone function as OSPF Area Border Routers (ABR) in the OSPF areas to which they are attached. In order to achieve full compatibility, they can also behave as AS Boundary Routers (ASBR) in non-stub areas.

The PE-routers insert inter-area routes from other areas into the area in which the CE-router is present. The CE-routers are not involved at any level nor are they aware of the super backbone or of other OSPF areas present beyond the MPLS VPN super backbone.

The CE always assumes the PE is an ABR:

- If the CE is in the backbone then the CE router assumes that the PE is an ABR linking one or more areas to the backbone.
- If the CE in not in the backbone then the CE believes that the backbone is on the other side of the PE.
- As such the super backbone looks like another area to the CE.

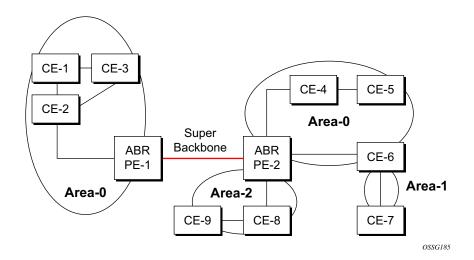

Figure 8: PEs Connected to an MPLS-VPN Super Backbone

In Figure 8, the PEs are connected to the MPLS-VPN super backbone. In order to be able to distinguish if two OSPF instances are in fact the same and require Type 3 LSAs to be generated or are two separate routing instances where type 5 external LSAs need to be generated the concept of a domain-id is introduced.

The domain ID is carried with the MP-BGP update and indicates the source OSPF Domain. When the routes are being redistributed into the same OSPF Domain, the concepts of super backbone described above apply and Type 3 LSAs should be generated. If the OSPF domain does not match, then the route type will be external.

Configuring the super backbone (not the sham links) makes all destinations learned by PEs with matching domain IDs inter-area routes.

When configuring sham links, these links become intra-area routes if they are present in the same area.

Sham Links

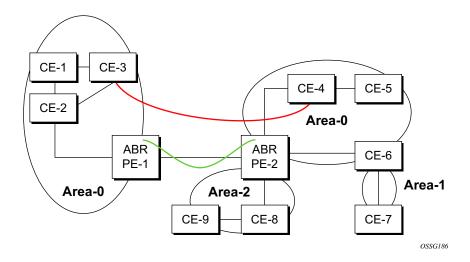

Figure 9: Sham Links

Figure 9 displays the red link between CE-3 and CE-4 could be a low speed OC-3/STM-1 link but because it establishes a intra-area route connecton between the CE-3 and CE-4 the potentially high-speed PE-1 to PE-2 connection will not be utilized. Even with a super backbone configuration it is regarded as a inter-area connection.

The establishment of the (green) sham-link is also constructed as an intra-area link between PE routers, a normal OSPF adjacency is formed and the link-state database is exchanged across the MPLS-VPRN. As a result, the desired intra-area connectivity is created, at this time the cost of the green and red links can be managed such that the red link becomes a standby link only in case the VPN fails.

As the shamlink forms an adjacency over the MPLS-VPRN backbone network, be aware that when protocol-protection is enabled in the **config>sys>security>cpu-protection>protocol-protection** context, the operator must explicit allow the OSPF packets to be received over the backbone network. This performed using the the **allow-sham-links** parameter of the **protocol-protection** command.

Implementing the OSPF Super Backbone

With the OSPF super backbone architecture, the continuity of OSPF routing is preserved:

- The OSPF intra-area LSAs (type-1 and type-2) advertised by the CE are inserted into the MPLS-VPRN super backbone by redistributing the OSPF route into MP-BGP by the PE adjacent to the CE.
- The MP-BGP route is propagated to other PE-routers and inserted as an OSPF route into other OSPF areas. Considering the PEs across the super backbone always act as ABRs they will generate inter area route OSPF summary LSAs, Type 3.
- The inter-area route can now be propagated into other OSPF areas by other customer owned ABRs within the customer site.
- Customer Area 0 (backbone) routes when carried across the MPLS-VPRN using MPBGP will appear as Type 3 LSAs even if the customer area remains area 0 (backbone).

A BGP extended community (OSPF domain ID) provides the source domain of the route. This domain ID is not carried by OSPF but carried by MP-BGP as an extended community attribute.

If the configured extended community value matches the receiving OSPF domain, then the OSPF super backbone is implemented.

From a BGP perspective, the cost is copied into the MED attribute.

Loop Avoidance

If a route sent from a PE router to a CE router could then be received by another PE router from one of its own CE routers then it is possible for routing loops to occur. RFC 4577 specifies several methods of loop avoidance.

DN-BIT

When a Type 3 LSA is sent from a PE router to a CE router, the DN bit in the LSA options field is set. This is used to ensure that if any CE router sends this Type 3 LSA to a PE router, the PE router will not redistribute it further.

When a PE router needs to distribute to a CE router a route that comes from a site outside the latter's OSPF domain, the PE router presents itself as an ASBR (Autonomous System Border Router), and distributes the route in a type 5 LSA. The DN bit MUST be set in these LSAs to ensure that they will be ignored by any other PE routers that receive them.

DN-BIT loop avoidance is also supported.

Route Tag

If a particular VRF in a PE is associated with an instance of OSPF, then by default it is configured with a special OSPF route tag value called the VPN route tag. This route tag is included in the Type 5 LSAs that the PE originates and sends to any of the attached CEs. The configuration and inclusion of the VPN Route Tag is required for backward compatibility with deployed implementations that do not set the DN bit in Type 5 LSAs.

Sham Links

A sham link is only required if a backdoor link (shown as the red link in Figure 9) is present, otherwise configuring an OSPF super backbone will probably suffice.

OSPFv3 Authentication

OSPFv3 authentication requires IPv6 IPsec and supports the following:

- IPsec transport mode
- AH and ESP
- Manual keyed IPsec Security Association (SA)
- Authentication Algorithms MD5 and SHA1

To pass OSPFv3 authentication, OSPFv3 peers must have matching inbound and outbound SAs configured using the same SA parameters (SPI, keys, etc.). THe implementation must allow the use of one SA for both inbound and outbound directions.

This feature is supported on IES and VPRN interfaces as well as on virtual links.

The re-keying procedure defined in RFC 4552 supports the following:

- For every router on the link, create an additional inbound SA for the interface being rekeyed using a new SPI and the new key.
- For every router on the link, replace the original outbound SA with one using the new SPI and key values. The SA replacement operation should be atomic with respect to sending OSPFv3 packet on the link so that no OSPFv3 packets are sent without authentication or encryption.
- For every router on the link, remove the original inbound SA.

The key rollover procedure automatically starts when the operator changes the configuration of the inbound static-sa or bi-directional static-sa under an interface or virtual link. Within the KeyRolloverInterval time period, OSPF3 accepts packets with both the previous inbound static-sa and the new inbound static-sa, and the previous outbound static-sa should continue to be used. When the timer expires, OSPF3 will only accept packets with the new inbound static-sa and for outgoing OSPF3 packets, the new outbound static-sa will be used instead.

Virtual Links

The backbone area in an OSPF AS must be contiguous and all other areas must be connected to the backbone area. Sometimes, this is not possible. You can use virtual links to connect to the backbone through a non-backbone area.

Figure 7 depicts routers Y and Z as the start and end points of the virtual link while area 0.0.0.4 is the transit area. In order to configure virtual links, the router must be an ABR. Virtual links are identified by the router ID of the other endpoint, another ABR. These two endpoint routers must be attached to a common area, called the transit area. The area through which you configure the virtual link must have full routing information.

Transit areas pass traffic from an area adjacent to the backbone or to another area. The traffic does not originate in, nor is it destined for, the transit area. The transit area cannot be a stub area or a NSSA area.

Virtual links are part of the backbone, and behave as if they were unnumbered point-to-point networks between the two routers. A virtual link uses the intra-area routing of its transit area to forward packets. Virtual links are brought up and down through the building of the shortest-path trees for the transit area.

Neighbors and Adjacencies

A router uses the OSPF Hello protocol to discover neighbors. A neighbor is a router configured with an interface to a common network. The router sends hello packets to a multicast address and receives hello packets in return.

In broadcast networks, a designated router and a backup designated router are elected. The designated router is responsible for sending link-state advertisements (LSAs) describing the network, which reduces the amount of network traffic.

The routers attempt to form adjacencies. An adjacency is a relationship formed between a router and the designated or backup designated router. For point-to-point networks, no designated or backup designated router is elected. An adjacency must be formed with the neighbor.

To significantly improve adjacency forming and network convergence, a network should be configured as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

When the link-state databases of two neighbors are synchronized, the routers are considered to be fully adjacent. When adjacencies are established, pairs of adjacent routers synchronize their topological databases. Not every neighboring router forms an adjacency. Routing protocol updates are only sent to and received from adjacencies. Routers that do not become fully adjacent remain in the two-way neighbor state.

Link-State Advertisements

Link-state advertisements (LSAs) describe the state of a router or network, including router interfaces and adjacency states. Each LSA is flooded throughout an area. The collection of LSAs from all routers and networks form the protocol's topological database.

The distribution of topology database updates take place along adjacencies. A router sends LSAs to advertise its state according to the configured interval and when the router's state changes. These packets include information about the router's adjacencies, which allows detection of non-operational routers.

When a router discovers a routing table change or detects a change in the network, link state information is advertised to other routers to maintain identical routing tables. Router adjacencies are reflected in the contents of its link state advertisements. The relationship between adjacencies and the link states allow the protocol to detect non-operating routers. Link state advertisements flood the area. The flooding mechanism ensures that all routers in an area have the same topological database. The database consists of the collection of LSAs received from each router belonging to the area.

OSPF sends only the part that has changed and only when a change has taken place. From the topological database, each router constructs a tree of shortest paths with itself as root. OSPF distributes routing information between routers belonging to a single AS.

Metrics

In OSPF, all interfaces have a cost value or routing metric used in the OSPF link-state calculation. A metric value is configured based on hop count, bandwidth, or other parameters, to compare different paths through an AS. OSPF uses cost values to determine the best path to a particular destination: the lower the cost value, the more likely the interface will be used to forward data traffic.

Costs are also associated with externally derived routing data, such as those routes learned from the Exterior Gateway Protocol (EGP), like BGP, and is passed transparently throughout the AS. This data is kept separate from the OSPF protocol's link state data. Each external route can be tagged by the advertising router, enabling the passing of additional information between routers on the boundaries of the AS.

Authentication

All OSPF protocol exchanges can be authenticated. This means that only trusted routers can participate in autonomous system routing. Alcatel-Lucent's implementation of OSPF supports plain text and Message Digest 5 (MD5) authentication (also called simple password).

MD5 allows an authentication key to be configured per network. Routers in the same routing domain must be configured with the same key. When the MD5 hashing algorithm is used for authentication, MD5 is used to verify data integrity by creating a 128-bit message digest from the data input. It is unique to that data. Alcatel-Lucent's implementation of MD5 allows the migration of an MD5 key by using a key ID for each unique key.

By default, authentication is not enabled on an interface.

IP Subnets

OSPF enables the flexible configuration of IP subnets. Each distributed OSPF route has a destination and mask. A network mask is a 32-bit number that indicates the range of IP addresses residing on a single IP network/subnet. This specification displays network masks as hexadecimal numbers; for example, the network mask for a class C IP network is displayed as 0xffffff00. Such a mask is often displayed as 255.255.255.0.

Two different subnets with same IP network number have different masks, called variable length subnets. A packet is routed to the longest or most specific match. Host routes are considered to be subnets whose masks are all ones (0xffffffff).

Preconfiguration Recommendations

Prior to configuring OSPF, the router ID must be available. The router ID is a 32-bit number assigned to each router running OSPF. This number uniquely identifies the router within an AS. OSPF routers use the router IDs of the neighbor routers to establish adjacencies. Neighbor IDs are learned when Hello packets are received from the neighbor.

Before configuring OSPF parameters, ensure that the router ID is derived by one of the following methods:

- Define the value in the **config>router** *router-id* context.
- Define the system interface in the **config>router>interface** *ip-int-name* context (used if the router ID is not specified in the **config>router** *router-id* context).
 - A system interface must have an IP address with a 32-bit subnet mask. The system interface is used as the router identifier by higher-level protocols such as OSPF and IS-IS. The system interface is assigned during the primary router configuration process when the interface is created in the logical IP interface context.
- If you do not specify a router ID, then the last four bytes of the MAC address are used.

Configuring OSPF

NOTE: On the BGP protocol level, a BGP router ID can be defined in the **config>router>bgp** *router-id* context and is only used within BGP.

Multiple OSPF Instances

The main route table manager (RTM) can create multiple instances of OSPF by extending the current creation of an instance. A given interface can only be a member of a single OSPF instance. When an interface is configured in a given domain and needs to be moved to another domain the interface must first be removed from the old instance and re-created in the new instance.

Route Export Policies for OSPF

Route policies allow specification of the source OSPF process ID in the **from** and **to** parameters in the **config>router>policy-options>policy-statement>entry>from** context, for example **from protocol ospf** *instance-id*.

If an *instance-id* is specified, only routes installed by that instance are picked up for announcement. If no *instance-id* is specified, then only routes installed by the base instance is will be announced. The **all** keyword announces routes installed by all instances of OSPF.

When announcing internal (intra/inter-area) OSPF routes from another process, the default type should be type-1, and metric set to the route metric in RTM. For AS-external routes, by default the route type (type-1/2) should be preserved in the originated LSA, and metric set to the route metric in RTM. By default, the tag value should be preserved when an external OSPF route is announced by another process. All these can be changed with explicit action statements.

Export policy should allow a match criteria based on the OSPF route hierarchy, e.g. only intraarea, only inter-area, only external, only internal (intra/inter-area). There must also be a possibility to filter based on existing tag values.

Preventing Route Redistribution Loops

The legacy method for this was to assign a tag value to each OSPF process and mark each external route originated within that domain with that value. However, since the tag value must be preserved throughout different OSPF domains, this only catches loops that go back to the originating domain and not where looping occurs in a remote set of domains. To prevent this type of loop, the route propagation information in the LSA must be accumulative. The following method has been implemented:

- The OSPF tag field in the AS-external LSAs is treated as a bit mask, rather than a scalar value. In other words, each bit in the tag value can be independently checked, set or reset as part of the routing policy.
- When a set of OSPF domains are provisioned in a network, each domain is assigned a specific bit value in the 32-bit tag mask. When an external route is originated by an ASBR using an internal OSPF route in a given domain, a corresponding bit is set in the AS-external LSA. As the route gets redistributed from one domain to another, more bits are set in the tag mask, each corresponding to the OSPF domain the route visited. Route redistribution looping is prevented by checking the corresponding bit as part of the export policy--if the bit corresponding to the announcing OSPF process is already set, the route is not exported there.

From the CLI perspective, this involves adding a set of **from tag** and **action tag** commands that allow for bit operations.

OSPF Configuration Process Overview

Figure 10 displays the process to provision basic OSPF parameters.

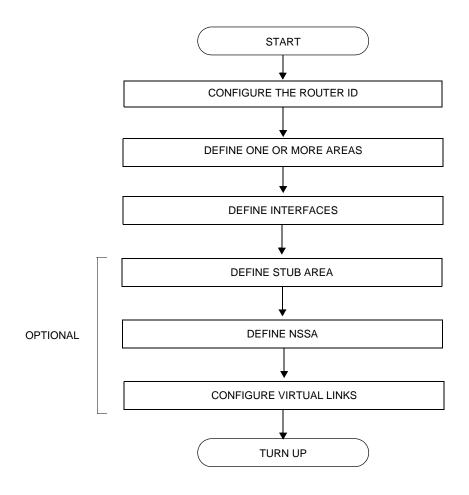

Figure 10: OSPF Configuration and Implementation Flow

Configuration Notes

This section describes OSPF configuration caveats.

General

- Before OSPF can be configured, the router ID must be configured.
- The basic OSPF configuration includes at least one area and an associated interface.
- All default and command parameters can be modified.

OSPF Defaults

The following list summarizes the OSPF configuration defaults:

- By default, a router has no configured areas.
- An OSPF instance is created in the administratively enabled state.

Configuring OSPF with CLI

This section provides information to configure Open Shortest Path First (OSPF) using the command line interface.

Topics in this section include:

- OSPF Configuration Guidelines on page 302
- Basic OSPF Configuration on page 303

OSPF Configuration Guidelines

Configuration planning is essential to organize routers, backbone, non-backbone, stub, NSSA areas, and transit links. OSPF provides essential defaults for basic protocol operability. You can configure or modify commands and parameters. OSPF is not enabled by default.

The minimal OSPF parameters which should be configured to deploy OSPF are:

Router ID

Each router running OSPF must be configured with a unique router ID. The router ID is used by both OSPF and BGP routing protocols in the routing table manager.

When configuring a new router ID, protocols will not automatically be restarted with the new router ID. Shut down and restart the protocol to initialize the new router ID.

OSPF Instance

OSPF instances must be defined when configuring multiple instances and/or the instance being configured is not the base instance.

An area

At least one OSPF area must be created. An interface must be assigned to each OSPF area.

Interfaces

An interface is the connection between a router and one of its attached networks. An interface has state information associated with it, which is obtained from the underlying lower level protocols and the routing protocol itself. An interface to a network has associated with it a single IP address and mask (unless the network is an unnumbered point-to-point network). An interface is sometimes also referred to as a link.

Basic OSPF Configuration

This section provides information to configure OSPF and OSPF3 as well as configuration examples of common configuration tasks.

The minimal OSPF parameters that need to be configured are:

- A router ID If a *router-id* is not configured in the config>router context, the router's system interface IP address is used.
- One or more areas.
- Interfaces (interface "system").

Following is an example of a basic OSPF configuration:

```
ALA-A>config>router>ospf# info
           area 0.0.0.0
               interface "system"
               exit
            exit
            area 0.0.0.20
               nssa
               exit
               interface "to-104"
                 priority 10
               exit
           exit
           area 0.0.1.1
ALA-A>config>router>ospf#
A:ALA-48>config>router>ospf3# info
           asbr
           overload
           timers
               lsa-arrival 50000
            export "OSPF-Export"
            area 0.0.0.0
               interface "system"
               exit
            exit
            area 0.0.0.20
               nssa
               exit.
               interface "SR1-2"
               exit
            exit
            area 0.0.0.25
                  default-metric 5000
               exit
            exit
```

Configuring the Router ID

The router ID uniquely identifies the router within an AS. In OSPF, routing information is exchanged between autonomous systems, groups of networks that share routing information. It can be set to be the same as the loopback (system interface) address. Subscriber services also use this address as far-end router identifiers when service distribution paths (SDPs) are created. The router ID is used by both OSPF and BGP routing protocols. A router ID can be derived by:

- Defining the value in the config>router router-id context.
- Defining the system interface in the config>router>interface *ip-int-name* context (used if the router ID is not specified in the config>router *router-id* context).
- Inheriting the last four bytes of the MAC address.
- On the BGP protocol level. A BGP router ID can be defined in the **config>router>bgp router-id** context and is only used within BGP.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is (re) initialized the new router ID is used. An interim period of time can occur when different protocols use different router IDs. To force the new router ID, issue the shutdown and no shutdown commands for each protocol that uses the router ID or restart the entire router.

The following displays a router ID configuration example:

Configuring OSPF Components

Use the CLI syntax displayed below for:

- Configuring OSPF Parameters on page 305
- Configuring OSPF3 Parameters on page 306
- Configuring a Stub Area on page 308
- Configuring a Not-So-Stubby Area on page 310
- Configuring a Virtual Link on page 312
- Configuring an Interface on page 314
- Configuring Authentication on page 316
- Assigning a Designated Router on page 319
- Configuring Route Summaries on page 321

Configuring OSPF Parameters

The following displays a basic OSPF configuration example:

```
A:ALA-49>config>router>ospf# info

asbr

overload

overload-on-boot timeout 60

traffic-engineering

export "OSPF-Export"

graceful-restart

helper-disable

exit

A:ALA-49>config>router>ospf# ex
```

Configuring OSPF3 Parameters

Use the following CLI syntax to configure OSPF3 parameters:

```
CLI Syntax: config>router# ospf3
             asbr
             export policy-name [policy-name...(upto 5 max)]
            external-db-overflow limit seconds
            external-preference preference
            overload [timeout seconds]
            overload-include-stub
            overload-on-boot [timeout seconds]
            preference preference
             reference-bandwidth bandwidth-in-kbps
             router-id ip-address
            no shutdown
             timers
                lsa-arrival lsa-arrival-time
                lsa-generate max-lsa-wait
                spf-wait max-spf-wait [spf-initial-wait [spf-second-
                   wait]]
```

The following displays an OSPF3 configuration example:

```
A:ALA-48>config>router>ospf3# info

asbr
overload
timers
lsa-arrival 50000
exit
export "OSPF-Export"

A:ALA-48>config>router>ospf3#
```

Configuring an OSPF or OSPF3 Area

An OSPF area consists of routers configured with the same area ID. To include a router in a specific area, the common area ID must be assigned and an interface identified.

If your network consists of multiple areas you must also configure a backbone area (0.0.0.0) on at least one router. The backbone is comprised of the area border routers and other routers not included in other areas. The backbone distributes routing information between areas. The backbone is considered to be a participating area within the autonomous system. To maintain backbone connectivity, there must be at least one interface in the backbone area or have a virtual link configured to another router in the backbone area.

The minimal configuration must include an area ID and an interface. Modifying other command parameters are optional.

Use the following CLI syntax to configure an OSPF or OSPF3 area:

The following displays an OSPF area configuration example:

```
A:ALA-A>config>router>ospf# info

area 0.0.0.0
exit
area 0.0.0.20
exit

ALA-A>config>router>ospf#A:
```

Configuring a Stub Area

Configure stub areas to control external advertisements flooding and to minimize the size of the topological databases on an area's routers. A stub area cannot also be configured as an NSSA.

By default, summary route advertisements are sent into stub areas. The **no** form of the summary command disables sending summary route advertisements and only the default route is advertised by the ABR. This example retains the default so the command is not entered.

If this area is configured as a transit area for a virtual link, then existing virtual links of a non-stub or NSSA area are removed when its designation is changed to NSSA or stub.

Stub areas for OSPF3 are configured the same as OSPF stub areas.

Use the following CLI syntax to configure virtual links:

The following displays a stub configuration example:

The following displays a stub configuration example:

```
ALA-A>config>router>ospf>area># info
...

area 0.0.0.0
exit
area 0.0.0.20
stub
exit
exit
...
```

ALA-A>config>router>ospf#

A:ALA-48>config>router>ospf3>area# info

stub

default-metric 5000

exit

 $\verb|A:ALA-48>config>router>ospf3>area#|$

Configuring a Not-So-Stubby Area

You must explicitly configure an area to be a Not-So-Stubby Area (NSSA) area. NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is an NSSA has the capability to flood external routes it learns throughout its area and by an area border router to the entire OSPF domain. An area cannot be both a stub area and an NSSA.

If this area is configured as a transit area for a virtual link, then existing virtual links of a non-stub or NSSA area are removed when its designation is changed to NSSA or stub.

Use the following CLI syntax to configure stub areas:

```
CLI Syntax: ospf ospf-instance
    ospf3
        area area-id
        nssa
        area-range ip-prefix/mask [advertise|not-advertise]
        originate-default-route [type-7]
        redistribute-external
        summaries
```

The following displays an NSSA configuration example:

```
A:ALA-49>config>router>ospf# info
_____
          asbr
         overload
          overload-on-boot timeout 60
          traffic-engineering
          export "OSPF-Export"
          graceful-restart
             helper-disable
          area 0.0.0.0
          exit
          area 0.0.0.20
             stub
             exit
          exit
          area 0.0.0.25
            nssa
             exit
          exit
A:ALA-49>config>router>ospf#
```

The following displays a OSPF3 NSSA configuration example:

```
A:ALA-48>config>router>ospf3# info
           asbr
           overload
          timers
             lsa-arrival 50000
           export "OSPF-Export"
           area 0.0.0.0
           exit
           area 0.0.0.20
             stub
           exit
           area 0.0.0.25
              nssa
              exit
           exit
           area 4.3.2.1
          exit
```

A:ALA-48>config>router>ospf3#

Configuring a Virtual Link

The backbone area (area 0.0.0.0) must be contiguous and all other areas must be connected to the backbone area. If it is not practical to connect an area to the backbone then the area border routers must be connected via a virtual link. The two area border routers will form a point-to-point-like adjacency across the transit area. A virtual link can only be configured while in the area 0.0.0.0 context.

The router-id parameter specified in the virtual-link command must be associated with the virtual neighbor, that is, enter the virtual neighbor's router ID, not the local router ID. The transit area cannot be a stub area or an NSSA.

Use the following CLI syntax to configure stub areas:

The following displays a virtual link configuration example:

```
A:ALA-49>config>router>ospf# info
           overload
           overload-on-boot timeout 60
           traffic-engineering
            export "OSPF-Export"
            graceful-restart
               helper-disable
            exit
            area 0.0.0.0
               virtual-link 1.2.3.4 transit-area 1.2.3.4
                   hello-interval 9
                   dead-interval 40
                exit
            exit
            area 0.0.0.20
               stub
               exit
            exit.
            area 0.0.0.25
```

The following displays an OSPF3 virtual link configuration example:

```
A:ALA-48>config>router>ospf3# info
_____
          asbr
          overload
             lsa-arrival 50000
          exit
          export "OSPF-Export"
          area 0.0.0.0
             virtual-link 4.3.2.1 transit-area 4.3.2.1
          exit
          area 0.0.0.20
             stub
             exit
          exit
          area 0.0.0.25
             nssa
             exit
          exit
          area 4.3.2.1
          exit
A:ALA-48>config>router>ospf3#
```

7750 SR OS Routing Protocols Guide

Configuring an Interface

In OSPF, an interface can be configured to act as a connection between a router and one of its attached networks. An interface includes state information that was obtained from underlying lower level protocols and from the routing protocol itself. An interface to a network is associated with a single IP address and mask (unless the network is an unnumbered point-to-point network). Note that if the address is removed from an interface, then all OSPF data for the interface is also removed. If the address is merely changed, then the OSPF configuration is preserved.

The passive command enables the passive property to and from the OSPF interface where passive interfaces are advertised as OSPF interfaces but do not run the OSPF protocol. By default, only interface addresses that are configured for OSPF are advertised as OSPF interfaces. The passive parameter allows an interface to be advertised as an OSPF interface without running the OSPF protocol. When enabled, the interface will ignore ingress OSPF protocol packets and not transmit any OSPF protocol packets.

Use the following CLI syntax to configure an OSPF interface:

```
CLI Syntax: ospf ospf-instance
            area area-id
               interface ip-int-name
                  advertise-subnet
                  authentication-key [authentication-key | hash-key]
                      [hash|hash2]
                  authentication-type [password|message-digest]
                  bfd-enable
                  dead-interval seconds
                  hello-interval seconds
                  interface-type {broadcast|point-to-point}
                  message-digest-key key-id md5 [key|hash-
                     key] [hash|hash2]
                  metric metric
                  mtu bytes
                  passive
                  priority number
                  retransmit-interval seconds
                  no shutdown
                  transit-delay seconds
```

The following displays an interface configuration example:

```
exit
           area 0.0.0.0
               virtual-link 1.2.3.4 transit-area 1.2.3.4
                  hello-interval 9
                   dead-interval 40
               exit
               interface "system"
            exit
            area 0.0.0.20
               stub
               interface "to-103"
               exit
            exit
           area 0.0.0.25
               nssa
               exit
            exit
           area 1.2.3.4
           exit
A:ALA-49>config>router>ospf# area 0.0.0.20
```

The following displays an interface configuration:

```
A:ALA-48>config>router>ospf3# info
           overload
           timers
               lsa-arrival 50000
           export "OSPF-Export"
            area 0.0.0.0
               virtual-link 4.3.2.1 transit-area 4.3.2.1
               interface "system"
               exit
            exit
           area 0.0.0.20
               stub
               exit
               interface "SR1-2"
               exit
            exit
            area 0.0.0.25
               nssa
               exit
           exit
           area 4.3.2.1
           exit
A:ALA-48>config>router>ospf3#
```

Configuring Authentication

Authentication must be explicitly configured. This feature is not available in the OSPF3 context. The following authentication commands can be configured on the interface level or the virtual link level:

- authentication-key Configures the password used by the OSPF interface or virtual-link to send and receive OSPF protocol packets on the interface when simple password authentication is configured.
- authentication-type Enables authentication and specifies the type of authentication to be used on the OSPF interface, either password or message digest.
- message-digest-key Use this command when message-digest keyword is selected in the authentication-type command. The Message Digest 5 (MD5) hashing algorithm is used for authentication. MD5 is used to verify data integrity by creating a 128-bit message digest from the data input. It is unique to that specific data.

An special checksum is included in transmitted packets and are used by the far-end router to verify the packet by using an authentication key (a password). Routers on both ends must use the same MD5 key.

MD5 can be configured on each interface and each virtual link. If MD5 is enabled on an interface, then that interface accepts routing updates only if the MD5 authentication is accepted. Updates that are not authenticated are rejected. A router accepts only OSPF packets sent with the same key-id value defined for the interface.

When the hash parameter is not used, non-encrypted characters can be entered. Once configured using the message-digest-key command, then all keys specified in the command are stored in encrypted format in the configuration file using the hash keyword. When using the hash keyword the password must be entered in encrypted form. Hashing cannot be reversed. Issue the no message-digest-key key-id command and then re-enter the command without the hash parameter to configure an unhashed key.

The following CLI commands are displayed to illustrate the key authentication features. These command parameters can be defined at the same time interfaces and virtual-links are being configured. See Configuring an Interface on page 314 and Configuring a Virtual Link on page 312.

Use the following CLI syntax to configure authentication:

```
virtual-link router-id transit-area area-id
  authentication-key [authentication-key|hash-key]
     [hash]
  authentication-type [password|message-digest]
  message-digest-key key-id md5 key [hash]
```

The following displays authentication configuration examples:

```
A:ALA-49>config>router>ospf# info
_____
           asbr
          overload
           overload-on-boot timeout 60
           traffic-engineering
           export "OSPF-Export"
           graceful-restart
              helper-disable
           exit
           area 0.0.0.0
              virtual-link 1.2.3.4 transit-area 1.2.3.4
                 hello-interval 9
                  dead-interval 40
               exit
              interface "system"
              exit
           exit
           area 0.0.0.20
              stub

exit
area 1.2.3.4
exit
```

A:ALA-49>config>router>ospf#

Page 318

Assigning a Designated Router

A designated router is elected according to the priority number advertised by the routers. When a router starts up, it checks for a current designated router. If a designated router is present, then the router accepts that designated router, regardless of its own priority designation. When a router fails, then new designated and backup routers are elected according their priority numbers.

The **priority** command is only used if the interface is a broadcast type. The designated router is responsible for flooding network link advertisements on a broadcast network to describe the routers attached to the network. A router uses hello packets to advertise its priority. The router with the highest priority interface becomes the designated router. A router with priority 0 is not eligible to be a designated router or a backup designated router. At least one router on each logical IP network or subnet must be eligible to be the designated router. By default, routers have a priority value of 1.

Use the following CLI syntax to configure the designated router:

The following displays a priority designation example:

```
A:ALA-49>config>router>ospf# info
            overload-on-boot timeout 60
            traffic-engineering
            export "OSPF-Export"
            graceful-restart
               helper-disable
            exit.
            area 0.0.0.0
               virtual-link 10.0.0.1 transit-area 0.0.0.1
                    authentication-type message-digest
                    message-digest-key 2 md5 "Mi6BQAFi3MI" hash
                virtual-link 1.2.3.4 transit-area 1.2.3.4
                    hello-interval 9
                    dead-interval 40
                interface "system"
                exit
            exit.
            area 0.0.0.1
            exit
            area 0.0.0.20
               stub
                exit
                interface "to-103"
```

Configuring OSPF Components

```
exit
exit

Configuring Route Summaries

Area border routers send summary (type 3) advertisements into a stub area or NSSA to describe the routes to other areas. This command is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or NSSA.

By default, summary route advertisements are sent into the stub area or NSSA. The no form of the summaries command disables sending summary route advertisements and, in stub areas, the default route is advertised by the area border router.

The following CLI commands are displayed to illustrate route summary features. These command parameters can be defined at the same time stub areas and NSSAs are being configured. See Configuring a Stub Area on page 308 and Configuring a Not-So-Stubby Area on page 310.

Use the following CLI syntax to configure a route summary:

```
CLI Syntax: ospf ospf-instance
area area-id
stub
summaries
nssa
summaries
```

The following displays a stub route summary configuration example:

```
A:ALA-49>config>router>ospf# info
            overload-on-boot timeout 60
            traffic-engineering
            export "OSPF-Export"
            graceful-restart
               helper-disable
            exit.
            area 0.0.0.0
               virtual-link 10.0.0.1 transit-area 0.0.0.1
                    authentication-type message-digest
                    message-digest-key 2 md5 "Mi6BQAFi3MI" hash
                exit
                virtual-link 1.2.3.4 transit-area 1.2.3.4
                    hello-interval 9
                    dead-interval 40
                interface "system"
                exit
            exit.
            area 0.0.0.1
            exit
            area 0.0.0.20
               stub
```

```
exit
               interface "to-103"
               exit
            exit
            area 0.0.0.25
               nssa
                exit
               interface "if2"
                  priority 100
                exit
            exit
            area 0.0.0.40
               interface "test1"
                   authentication-type password
                   authentication-key "3WErEDozxyQ" hash
               exit
            exit
            area 1.2.3.4
            exit
A:ALA-49>config>router>ospf#
A:ALA-48>config>router>ospf3# info
            asbr
           overload
            timers
               lsa-arrival 50000
            exit
            export "OSPF-Export"
            area 0.0.0.0
               virtual-link 4.3.2.1 transit-area 4.3.2.1
               interface "system"
                exit
            exit
            area 0.0.0.20
               stub
               exit
               interface "SR1-2"
            exit
            area 0.0.0.25
               nssa
            exit
            area 4.3.2.1
           exit
A:ALA-48>config>router>ospf3#
```

Configuring Route Preferences

A route can be learned by the router from different protocols, in which case, the costs are not comparable. When this occurs the preference value is used to decide which route is installed in the forwarding table if several protocols calculate routes to the same destination. The route with the lowest preference value is selected

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in Table 9. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

Table 9: Route Preference Defaults by Route Type

Route Type	Preference	Configurable	
Direct attached	0	No	
Static routes	5	Yes	
OSPF internal	10	Yes ^a	
IS-IS level 1 internal	15	Yes	
IS-IS level 2 internal	18	Yes	
OSPF external	150	Yes	
IS-IS level 1 external	160	Yes	
IS-IS level 2 external	165	Yes	
BGP	170	Yes	

a. Preference for OSPF internal routes is configured with the **preference** command.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The following CLI commands are displayed to illustrate route preference features. The command parameters can be defined at the same time you are configuring OSPF. See Configuring OSPF Components on page 305.

Use the following CLI syntax to configure a route preference:

The following displays a route preference configuration example:

```
A:ALA-49>config>router>ospf# info
           overload
           overload-on-boot timeout 60
           traffic-engineering
           preference 9
            external-preference 140
           export "OSPF-Export"
           graceful-restart
               helper-disable
            area 0.0.0.0
                virtual-link 10.0.0.1 transit-area 0.0.0.1
                   authentication-type message-digest
                   message-digest-key 2 md5 "Mi6BQAFi3MI" hash
                virtual-link 1.2.3.4 transit-area 1.2.3.4
                   hello-interval 9
                   dead-interval 40
                exit
               interface "system"
                exit
            exit
           area 0.0.0.1
            exit
            area 0.0.0.20
               stub
               exit
               interface "to-103"
            area 0.0.0.25
               nssa
               exit
               interface "if2"
                  priority 100
                exit
            exit
            area 0.0.0.40
               interface "test1"
                   authentication-type password
                   authentication-key "3WErEDozxyQ" hash
                exit
            exit
            area 1.2.3.4
            exit
```

A:ALA-49>config>router>ospf#

The following displays a route preference configuration example:

```
A:ALA-48>config>router>ospf3# info
           asbr
           overload
           timers
               lsa-arrival 50000
            preference 9
            external-preference 140
            export "OSPF-Export"
            area 0.0.0.0
               virtual-link 4.3.2.1 transit-area 4.3.2.1
               exit
               interface "system"
               exit
            exit
            area 0.0.0.20
               stub
               exit
               interface "SR1-2"
               exit
            exit
            area 0.0.0.25
               nssa
               exit
            exit
            area 4.3.2.1
           exit
A:ALA-48>config>router>ospf3#
```

OSPF Configuration Management Tasks

This section discusses the following OSPF configuration management tasks:

- Modifying a Router ID on page 326
- Deleting a Router ID on page 328
- Modifying OSPF Parameters on page 329

Modifying a Router ID

Since the router ID is defined in the config>router context, not in the OSPF configuration context, the protocol instance is not aware of the change. Re-examine the plan detailing the router ID. Changing the router ID on a device could cause configuration inconsistencies if associated values are not also modified.

After you have changed a router ID, manually shut down and restart the protocol using the shutdown and no shutdown commands in order for the changes to be incorporated.

Use the following CLI syntax to change a router ID number:

```
CLI Syntax: config>router# router-id router-id
```

The following displays a NSSA router ID modification example:

```
A:ALA-49>config>router# info
IP Configuration
______
      interface "system"
         address 10.10.10.104/32
      exit
      interface "to-103"
        address 10.0.0.103/24
        port 1/1/1
      exit
      autonomous-system 100
      router-id 10.10.10.104
A:ALA-49>config>router#
ALA-48>config>router# info
IP Configuration
_____
      interface "system"
        address 10.10.10.103/32
```

Deleting a Router ID

You can modify a router ID, but you cannot delete the parameter. When the no router routerid command is issued, the router ID reverts to the default value, the system interface address (which is also the loopback address). If a system interface address is not configured, then the last 32 bits of the chassis MAC address is used as the router ID.

Modifying OSPF Parameters

You can change or remove existing OSPF parameters in the CLI or NMS. The changes are applied immediately.

The following example displays an OSPF modification in which an interface is removed and another interface added.

The following example displays the OSPF configuration with the modifications entered in the previous example:

```
A:ALA-49>config>router>ospf# info
           asbr
           overload
            overload-on-boot timeout 60
            traffic-engineering
            preference 9
            external-preference 140
            export "OSPF-Export"
            graceful-restart
                helper-disable
            exit.
            area 0.0.0.0
                virtual-link 10.0.0.1 transit-area 0.0.0.1
                    authentication-type message-digest
                    message-digest-key 2 md5 "Mi6BQAFi3MI" hash
                virtual-link 1.2.3.4 transit-area 1.2.3.4
                   hello-interval 9
                   dead-interval 40
                exit
                interface "system"
                exit
            exit
            area 0.0.0.1
            exit
            area 0.0.0.20
               stub
                exit
                interface "to-HQ"
                   priority 50
                exit
            exit
            area 0.0.0.25
```

Configuration Commands

Generic Commands

shutdown

Syntax [no] shutdown

Context config>router>ospf

config>router>ospf3

config>router>ospf>area>interface config>router>ospf3>area>interface config>router>ospf>area>virtual-link config>router>ospf3>area>virtual-link

Description The **shutdown** command administratively disables the entity. When disabled, an entity does not change,

reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the

no shutdown command.

The **shutdown** command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

Default OSPF Protocol — The Open Shortest Path First (OSPF) protocol is created in the **no shutdown** state.

OSPF Interface — When an IP interface is configured as an OSPF interface, OSPF on the interface is in

the no shutdown state by default.

OSPF Global Commands

ospf

Syntax [no] ospf ospf-instance

Context config>router

Description This command configures the router ID for the OSPF instanceOSPF.

The router ID configured in the base instance of OSPF overrides the router ID configured in the **config>router** context.

The default value for the base instance is inherited from the configuration in the config>router context. When that is not configured the following applies:

- 1. The system uses the system interface address (which is also the loopback address).
- 2. If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

This is a required command when configuring multiple instances and the instance being configured is not the base instance. When configuring multiple instances of OSPF there is a risk of loops because networks are advertised by multiple domains configured with multiple interconnections to one another. To avoid this from happening all routers in a domain should be configured with the same domain-id. Each domain (OSPF-instance) should be assigned a specific bit value in the 32-bit tag mask.

The default value for non-base instances is 0.0.0.0 and is invalid, in this case the instance of OSPF will not start. When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

Issue the shutdown and no shutdown commands for the instance for the new router ID to be used, or reboot the entire router.

The **no** form of the command to reverts to the default value.

Default no ospf

ospf-instance — Specifies a unique integer that identifies a specific instance of a version of the OSPF protocol running in the router instance specified by the router ID.

Values 1 — 31

ospf3

Parameters

Syntax [no] ospf3

Context config>router

Description This command enables the context to configure OSPF to support version 6 of the Internet Protocol (IPv6).

When an OSPF instance is created, the protocol is enabled. To start or suspend execution of the OSPF protocol without affecting the configuration, use the **no shutdown** command.

The **no** form of the command deletes the OSPF protocol instance removing all associated configuration parameters.

Default no

no ospf — The OSPF protocol is not enabled.

asbr

Syntax [no] asbr [trace-path domain-id]

Context config>router>ospf config>router>ospf3

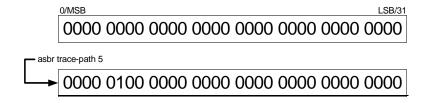

Description

This command configures the router as a Autonomous System Boundary Router (ASBR) if the router is to be used to export routes from the Routing Table Manager (RTM) into this instance of OSPF. Once a router is configured as an ASBR, the export policies into this OSPF domain take effect. If no policies are configured no external routes are redistributed into the OSPF domain.

The **no** form of the command removes the ASBR status and withdraws the routes redistributed from the Routing Table Manager into this instance of OSPF from the link state database.

When configuring multiple instances of OSPF there is a risk of loops because networks are advertised by multiple domains configured with multiple interconnections to one another. To avoid this from happening all routers in a domain should be configured with the same domain-id. Each domain (OSPF-instance) should be assigned a specific bit value in the 32-bit tag mask.

When an external route is originated by an ASBR using an internal OSPF route in a given domain, the corresponding bit is set in the AS-external LSA. As the route gets redistributed from one domain to another, more bits are set in the tag mask, each corresponding to the OSPF domain the route visited. Route redistribution looping is prevented by checking the corresponding bit as part of the export policy; if the bit corresponding to the announcing OSPF process is already set, the route is not exported there

Domain-IDs are incompatible with any other use of normal tags. The domain ID should be configured with a value between 1 and 31 by each router in a given OSPF domain (OSPF Instance).

When an external route is originated by an ASBR using an internal OSPF route in a given domain, the corresponding (1-31) bit is set in the AS-external LSA.

As the route gets redistributed from one domain to another, more bits are set in the tag mask, each corresponding to the OSPF domain the route visited. Route redistribution looping is prevented by checking the corresponding bit as part of the export policy; if the bit corresponding to the announcing OSPF process is already set, the route is not exported there.

Default no asbr — The router is not an ASBR.

Configuration Commands

Parameters domain-id — Specifies the domain ID.

> **Values** 1 - 31

Default

compatible-rfc1583

Syntax [no] compatible-rfc1583

Context config>router>ospf

Description This command enables OSPF summary and external route calculations in compliance with RFC1583 and

earlier RFCs.

RFC1583 and earlier RFCs use a different method to calculate summary and external route costs. To avoid

routing loops, all routers in an OSPF domain should perform the same calculation method.

Although it would be favorable to require all routers to run a more current compliancy level, this command

allows the router to use obsolete methods of calculation.

The no form of the command enables the post-RFC1583 method of summary and external route calculation.

Default compatible-rfc1583 — RFC1583 compliance is enabled.

disable-ldp-sync

Syntax [no] disable-ldp-sync

Context config>router>ospf

Description This command disables the IGP-LDP synchronization feature on all interfaces participating in the OSPF

> routing protocol. When this command is executed, IGP immediately advertises the actual value of the link cost for all interfaces which have the IGP-LDP synchronization enabled if the currently advertized cost is different. It will then disable IGP-LDP synchornization for all interfaces. This command does not delete the

interface configuration. The no form of this command has to be entered to re-enable IGP-LDP

synchronization for this routing protocol.

The **no** form of this command restores the default settings and re-enables IGP-LDP synchronization on all

interfaces participating in the OSPF or IS-IS routing protocol and for which the ldp-sync-timer is configured.

Default no disable-ldp-sync

export

Syntax export policy-name [policy-name...]

no export

Context config>router>ospf

config>router>ospf3

Description This command associates export route policies to determine which routes are exported from the route table

to OSPF. Export polices are only in effect if OSPF is configured as an ASBR.

If no export policy is specified, non-OSPF routes are not exported from the routing table manager to OSPF.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will

override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

Default no export — No export route policies specified.

Parameters policy-name — The export route policy name. Allowed values are any string up to 32 characters long

composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

export-limit

Syntax export-limit number [log percentage]

no export-limit

Context config>router>ospf

config>router>ospf3

Description This command configures the maximum number of routes (prefixes) that can be exported into OSPF from

the route table.

The **no** form of the command removes the parameters from the configuration.

Default no export-limit, the export limit for routes or prefixes is disabled..

Parameters number — Specifies the maximum number of routes (prefixes) that can be exported into OSPF from the

route table.

Values 1 — 4294967295

log percentage — Specifies the percentage of the export-limit, at which a warning log message and SNMP

notification would be sent.

Values 1 — 100

external-db-overflow

Syntax external-db-overflow limit interval

no external-db-overflow

Context config>router>ospf

config>router>ospf3

Description This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the

LSDB and specifies a wait timer before processing these after the limit is exceeded.

The *limit* value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the *limit*, the table is in an overflow state. When in an overflow state, the router will not originate any new AS-external-LSAs. In fact, it withdraws all the self-originated non-default external LSAs.

The *interval* specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period preventing the router from continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.

The **external-db-overflow** must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.

The no form of the command disables limiting the number of non-default AS-external-LSA entries.

Default no external-db-overflow — No limit on non-default AS-external-LSA entries.

Parameters limit — The maximum number of non-default AS-external-LSA entries that can be stored in the LSDB

before going into an overflow state expressed as a decimal integer.

Values 0 — 2147483674

interval — The number of seconds after entering an overflow state before attempting to process non-default

AS-external-LSAs expressed as a decimal integer.

Values 0 — 2147483674

external-preference

Syntax external-preference preference

no external-preference

Context config>router>ospf

config>router>ospf3

Description This command configures the preference for OSPF external routes.

A route can be learned by the router from different protocols, in which case, the costs are not comparable.

When this occurs the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the Table 10, "Route Preference Defaults by Route Type," on page 343. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the config>router context.

The **no** form of the command reverts to the default value.

Default

external-preference 150 — OSPF external routes have a default preference of 150.

Parameters

preference — The preference for external routes expressed as a decimal integer. Defaults for different route types are listed in Table 10.

Table 10: Route Preference Defaults by Route Type

Route Type	Preference	Configurable
Direct attached	0	No
Static routes	5	Yes
OSPF internal	10	Yes*
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes
RIP	100	Yes
OSPF external	150	Yes
IS-IS level 1 external	160	Yes
IS-IS level 2 external	165	Yes
BGP	170	Yes

^{*.} Preference for OSPF internal routes is configured with the **preference** command.

Values 1 — 255

graceful-restart

Syntax	[no] graceful-restart
Context	config>router>ospf
Description	This command enables graceful-restart for OSPF. When the control plane of a GR-capable router fails, the neighboring routers (GR helpers) temporarily preserve adjacency information, so packets continue to be

forwarded through the failed GR router using the last known routes. If the control plane of the GR router

Configuration Commands

comes back up within the GR timer, then the routing protocols would re-converge to minimize service interruption.

The **no** form of the command disables graceful restart and removes all graceful restart configurations in the

OSPF instance.

Default no graceful-restart

helper-disable

Syntax [no] helper-disable

Context config>router>ospf>graceful-restart

Description This command disables the helper support for graceful restart.

When **graceful-restart** is enabled, the router can be a helper (meaning that the router is helping a neighbor to restart) or be a restarting router or both. The 7750 SR OS supports only helper mode. This facilitates the graceful restart of neighbors but will not act as a restarting router (meaning that the 7750 SR OS will not help

the neighbors to restart).

The **no helper-disable** command enables helper support and is the default when graceful-restart is enabled.

Default disabled

Idp-over-rsvp

Syntax [no] ldp-over-rsvp

Context config>router>ospf

Description This command allows LDP-over-RSVP processing in this OSPF instance.

mcast-import-ipv6

Syntax [no] mcast-import-ipv6

Context configure>router>ospf3

Description This command administratively enables the submission of routes into the IPv6 multicast RTM by OSPF3.

The no form of the command disables the submission of the routes.

multicast-import

Syntax [no] multicast-import

Context config>router>ospf

Description This command enables the submission of routes into the multicast Route Table Manager (RTM) by OSPF.

The **no** form of the command disables the submission of routes into the multicast RTM.

Default no multicast-import

overload

Syntax overload [timeout seconds]

no overload

Context config>router>ospf

config>router>ospf3

Description This command changes the overload state of the local router so that it appears to be overloaded. When

overload is enabled, the router can participate in OSPF routing, but is not used for transit traffic. Traffic

destined to directly attached interfaces continues to reach the router.

To put the IGP in an overload state enter a timeout value. The IGP will enter the overload state until the

timeout timer expires or a no overload command is executed.

If the **overload** command is encountered during the execution of an **overload-on-boot** command then this command takes precedence. This could occur as a result of a saved configuration file where both parameters are saved. When the file is saved by the system the **overload-on-boot** command is saved after the **overload** command. **However**, when **overload-on-boot** is configured under OSPF with no timeout value configured, the router will remain in overload state indefinitely after a reboot.

Use the **no** form of this command to return to the default. When the **no overload** command is executed, the

overload state is terminated regardless of the reason the protocol entered overload state.

Default no overload

Parameters timeout seconds — Specifies the number of seconds to reset overloading.

Values 1 — 1800

Default 60

overload-include-stub

Syntax [no] overload-include-stub

Context config>router>ospf

config>router>ospf3

Description This command is used to to determine if the OSPF stub networks should be advertised with a maximum

metric value when the system goes into overload state for any reason. When enabled, the system uses the maximum metric value. When this command is enabled and the router is in overload, all stub interfaces,

including loopback and system interfaces, will be advertised at the maximum metric.

Default no overload-include-stub

overload-on-boot

Syntax overload-on-boot [timeout seconds]

no overload

Context config>router>ospf

config>router>ospf3

Description When the router is in an overload state, the router is used only if there is no other router to reach the

destination. This command configures the IGP upon bootup in the overload state until one of the following

events occur:

• The timeout timer expires.

• A manual override of the current overload state is entered with the **no overload** command.

The **no overload** command does not affect the **overload-on-boot** function.

The **no** form of the command removes the overload-on-boot functionality from the configuration.

The default timeout value is 60 seconds, which means after 60 seconds overload status the SR will recover (change back to non-overload status). However, when overload-on-boot is configured under OSPF with no

timeout value the router will remain in overload state indefinitely after a reboot.

Parameters timeout seconds — Specifies the number of seconds to reset overloading.

Values 1 — 1800

Default indefinitely in overload.

preference

Syntax preference preference

no preference

Context config>router>ospf

config>router>ospf3

A route can be learned by the router from different protocols, in which case, the costs are not comparable. When this occurs the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in Table 11. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the config>router context.

The **no** form of the command reverts to the default value.

This command configures the preference for OSPF internal routes.

Default preference 10 — OSPF internal routes have a preference of 10.

Parameters

preference — The preference for internal routes expressed as a decimal integer. Defaults for different route types are listed in Table 11.

Table 11: Route Preference Defaults by Route Type

Route Type	Preference	Configurable
Direct attached	0	No
Static routes	5	Yes
OSPF internal	10	Yes*
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes
RIP	100	Yes
OSPF external	150	Yes
IS-IS level 1 external	160	Yes
IS-IS level 2 external	165	Yes
BGP	170	Yes

^{*.} Preference for OSPF internal routes is configured with the **preference** command.

Values 1 — 255

reference-bandwidth

Syntax reference-bandwidth reference-bandwidth

no reference-bandwidth

Context config>router>ospf

config>router>ospf3

Description This command configures the reference bandwidth in kilobits per second (Kbps) that provides the reference

for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference-bandwidth ÷ bandwidth

The default *reference-bandwidth* is 100,000,000 Kbps or 100 Gbps, so the default auto-cost metrics for various link speeds are as as follows:

- 10 Mbs link default cost of 10000
- 100 Mbs link default cost of 1000
- 1 Gbps link default cost of 100
- 10 Gbps link default cost of 10

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** metric command in the config>router>ospf>area>interface ip-int-name context.

The **no** form of the command reverts the reference-bandwidth to the default value.

Default reference-bandwidth 100000000 — Reference bandwidth of 100 Gbps.

Parameters reference-bandwidth — The reference bandwidth in kilobits per second expressed as a decimal integer.

Values 1 — 1000000000

router-id

Syntax router-id ip-address

no router-id

Context config>router>ospf

config>router>ospf3

Description This command configures the router ID for the OSPF instance. This command configures the router ID for

the OSPF instance.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the

config>router context.

The default value for the base instance is inherited from the configuration in the **config>router** context. If

the router ID in the t**config>router** context is not configured, the following applies:

- The system uses the system interface address (which is also the loopback address).
- If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

The **no** form of the command to reverts to the default value.

Default

The default value for non-base instances is 0.0.0.0 and is invalid, in this case the instance of OSPF will not start and when doing a show command an error condition will be displayed.

Parameters

ip-address — Specifies a 32-bit, unsigned integer uniquely identifying the router in the Autonomous System.

rsvp-shortcut

Syntax [no] rsvp-shortcut

Context config>router>ospf

Description

This command enables the use of an RSVP-TE shortcut for resolving IGP routes by IS-IS or OSPF routing protocols.

This command instructs IS-IS or OSPF to include RSVP LSPs originating on this node and terminating on the router-id of a remote node as direct links with a metric equal to the operational metric provided by MPLS.

When **rsvp-shortcut** is enabled at the IGP instance level, all RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config-**

ure>router>mpls>lsp>to, corresponds to a router-id of a remote node. RSVP LSPs with a destination address corresponding to an interface address of a remote node are automatically not considered by IS-IS or OSPF. The user can however exclude a specific RSVP LSP from being used as a shortcut for resolving IGP routes by entering the command **config>router>mpls>lsp>no igp-shortcut**.

Also, the SPF in OSPF or IS-IS will only use RSVP LSPs as IGP shortcuts or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If the user enabled both options at the IGP instance level, then the shortcut application takes precedence when the LSP level configuration has both options enabled.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet in RTM will result in the resolution of the packet to an RSVP LSP if all the following conditions are satisfied:

- RSVP shortcut is enabled on the IGP routing protocol which has a route for the packet's destination address.
- SPF has pre-determined that the IGP path cost using the RSVP LSP shortcut is the best.

In this case, the packet is sent labeled with the label stack corresponding to the NHLFE of the RSVP LSP.

Configuration Commands

The failure of an RSVP LSP shortcut or of a local interface triggers a full SPF computation which may result in installing a new route over another RSVP LSP shortcut or a regular IP next-hop.

When ECMP is enabled and multiple equal-cost paths exist for the IGP route, the ingress IOM will spray the packets for this route based on hashing routine currently supported for IPv4 packets. Spraying will be performed across a regular IP next-hop and across an RSVP shortcut next-hop as long as the IP path does not go over the tail-end of the RSVP LSP.

The no form of this command disables the resolution of IGP routes using RSVP shortcuts.

Default no rsvp-shortcut

advertise-tunnel-links

Syntax [no] advertise-tunnel-links

Context config>router>ospf

Description This command enables the advertisement of RSVP LSP shortcuts into IGP similar to regular links so that

other routers in the network can include them in their SPF computations. An LSP must exist in the reverse direction in order for the advertized link to pass the bi-directional link check and be usable by other routers

in the network. However, this is not required for the node which originates the LSP.

The LSP is advertised as an unnumbered point-to-point link and the link LSP/LSA has no Traffic

Engineering opaque sub-TLVs per RFC 3906.

The no form of this command disables the advertisement of RSVP LSP shortcuts into IGP.

Default no advertise-tunnel-links

super-backbone

Syntax [no] super-backbone

Context config>service>vprn>ospf

Description This command specifies whether CE-PE functionality is required or not. The OSPF super backbone indicates

the type of the LSA generated as a result of routes redistributed into OSPF. When enabled, the redistributed routes are injected as summary, external or NSSA LSAs. When disabled, the redistributed routes are injected

as either external or NSSA LSAs only.

Refer to the OS Services Guide for syntax and command usage information.

The no form of the command disables the the super-backbone functionality.

Default no super-backbone

timers

Syntax timers

Context config>router>ospf

config>router>ospf3

Description This command enables the context that allows for the configuration of OSPF timers. Timers control the

delay between receipt of a link state advertisement (LSA) requiring a Dijkstra (Shortest Path First (SPF))

calculation and the minimum time between successive SPF calculations.

Changing the timers affects CPU utilization and network reconvergence times. Lower values reduce convergence time but increase CPU utilization. Higher values reduce CPU utilization but increase

reconvergence time.

Default none

Isa-arrival

Syntax Isa-arrival Isa-arrival-time

no Isa-arrival

Context config>router>ospf>timers

config>router>ospf3

Description This parameter defines the minimum delay that must pass between receipt of the same Link State

Advertisements (LSAs) arriving from neighbors.

It is recommended that the neighbors configured (Isa-generate) Isa-second-wait interval is equal or greater

then the **lsa-arrival** timer configured here.

Use the **no** form of this command to return to the default.

Default no Isa-arrival

Parameters *lsa-arrival-time* — Specifies the timer in milliseconds. Values entered that do not match this requirement

will be rejected.

Values 0 - 600000

Isa-generate

Syntax Isa-generate max-lsa-wait [Isa-initial-wait [Isa-second-wait]]

no Isa-generate-interval

Context config>router>ospf>timers

config>router>ospf3

Description This parameter customizes the throttling of OSPF LSA-generation. Timers that determine when to generate

the first, second, and subsequent LSAs can be controlled with this command. Subsequent LSAs are generated at increasing intervals of the *lsa-second-wait* timer until a maximum value is reached.

Configuration Commands

Configuring the **lsa-arrival** interval to equal or less than the *lsa-second-wait* interval configured in the **lsa-generate** command is recommended.

Use the **no** form of this command to return to the default.

Default no lsa-generate

Parameters

max-lsa-wait — Specifies the maximum interval, in milliseconds, between two consecutive ocurrences of an LSA being generated.

Values 10 — 600,000 **Default** 5,000 milliseconds

Isa-initial-wait — Specifies the first waiting period between link-state advertisements (LSA) originate(s), in milliseconds. When the LSA exceeds the Isa-initial-wait timer value and the topology changes, there is no wait period and the LSA is immediately generated.

When an LSA is generated, the initial wait period commences. If, within the specified lsa-initial-wait period and another topology change occurs, then the lsa-initial-wait timer applies.

Values 10 — 600000

Default 5,000 milliseconds

Isa-second-wait — Specifies the hold time in milliseconds between the first and second LSA generation. The next topology change is subject to this second wait period. With each subsequent topology change, the wait time doubles (this is 2x the previous wait time.). This assumes that each failure occurs within the relevant wait period.

Values 10 — 600000 **Default** 5,000 milliseconds

spf-wait

Syntax spf-wait *max-spf-wait* [*spf-initial-wait* [*spf-second-wait*]]

no spf-wait

Context config>router>ospf>timers

config>router>ospf3

Description This command defines the maximum interval between two consecutive SPF calculations in milliseconds.

Timers that determine when to initiate the first, second, and subsequent SPF calculations after a topology change occurs can be controlled with this command. Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the **spf-wait** value. The SPF interval will stay at the **spf-wait** value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to *spf-initial-wait*.

The timer must be entered in increments of 100 milliseconds. Values entered that do not match this requirement will be rejected.

Use the **no** form of this command to return to the default.

Default no spf-wait

Parameters max-spf-wait — Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

Values 10 — 120000

Default 1000

spf-initial-wait — Specifies the initial SPF calculation delay in milliseconds after a topology change.

Values 10 — 100000

Default 1000

spf-second-wait — Specifies the hold time in milliseconds between the first and second SPF calculation.

Values 10 — 100000

Default 1000

traffic-engineering

Syntax [no] traffic-engineering

Context config>router>ospf

Description This command enables traffic engineering route calculations constrained by nodes or links.

Traffic engineering enables the router to perform route calculations constrained by nodes or links. The traffic engineering capabilities of this router are limited to calculations based on link and nodal constraints.

The **no** form of the command disables traffic engineered route calculations.

Default no traffic-engineering — Traffic engineered route calculations is disabled.

unicast-import-disable

Syntax [no] unicast-import-disable

Context config>router>ospf

Description This command allows one IGP to import its routes into RPF RTM while another IGP imports routes only

into the unicast RTM. Import policies can redistribute routes from an IGP protocol into the RPF RTM (the multicast routing table). By default, the IGP routes will not be imported into RPF RTM as such an import

policy must be explicitly configured.

Default disabled

OSPF Area Commands

area

Syntax [no] area area-id

Context config>router>ospf

config>router>ospf3

Description This command creates the context to configure an OSPF or OSPF3 area. An area is a collection of network

segments within an AS that have been administratively grouped together. The area ID can be specified in

dotted decimal notation or as a 32-bit decimal integer.

The **no** form of the command deletes the specified area from the configuration. Deleting the area also

removes the OSPF configuration of all the interfaces, virtual-links, and address-ranges etc., that are currently

assigned to this area.

Default no area — No OSPF areas are defined.

Parameters area-id — The OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

Values 0.0.0.0 — 255.255.255.255 (dotted decimal), 0 — 4294967295 (decimal integer)

area-range

Syntax area-range ip-prefix/mask [advertise | not-advertise]

no area-range ip-prefix/mask

Context config>router>ospf>area

config>router>ospf>area>nssa

Description This command creates ranges of addresses on an Area Border Router (ABR) for the purpose of route

summarization or suppression. When a range is created, the range is configured to be advertised or not advertised into other areas. Multiple range commands may be used to summarize or hide different ranges. In

the case of overlapping ranges, the most specific range command applies.

ABRs send summary link advertisements to describe routes to other areas. To minimize the number of advertisements that are flooded, you can summarize a range of IP addresses and send reachability

information about these addresses in an LSA.

The **no** form of the command deletes the range (non) advertisement.

Default no area-range — No range of addresses are defined.

Special Cases NSSA Context — In the NSSA context, the option specifies that the range applies to external routes (via

type-7 LSAs) learned within the NSSA when the routes are advertised to other areas as type-5 LSAs.

Area Context — If this command is not entered under the NSSA context, the range applies to summary

LSAs even if the area is an NSSA.

Parameters

ip-prefix — The IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-pro

ip-prefix/mask:

ip-prefix a.b.c.d (host bits must be 0)

mask — The subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

Values

0 — 32 (mask length), 0.0.0.0 — 255.255.255 (dotted decimal)

advertise | not-advertise — Specifies whether or not to advertise the summarized range of addresses into other areas. The advertise keyword indicates the range will be advertised, and the keyword not-advertise indicates the range will not be advertised.

The default is advertise.

area-range

Syntax area-range ipv6-prefix/prefix-length [advertise | not-advertise]

no area-range ip-prefix/prefix-length

Context config>router>ospf3>area

config>router>ospf3>area>nssa

Description

This command creates ranges of addresses on an Area Border Router (ABR) for the purpose of route summarization or suppression. When a range is created, the range is configured to be advertised or not advertised into other areas. Multiple range commands may be used to summarize or hide different ranges. In the case of overlapping ranges, the most specific range command applies.

ABRs send summary link advertisements to describe routes to other areas. To minimize the number of advertisements that are flooded, you can summarize a range of IP addresses and send reachability information about these addresses in an LSA.

The **no** form of the command deletes the range (non) advertisement.

Default

no area-range — No range of addresses are defined.

Special Cases

NSSA Context — In the NSSA context, the option specifies that the range applies to external routes (via type-7 LSAs) learned within the NSSA when the routes are advertised to other areas as type-5 LSAs.

Area Context — If this command is not entered under the NSSA context, the range applies to summary LSAs even if the area is an NSSA.

Parameters

ip-prefix/prefix-length — The IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

Values ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

prefix-length: 0 - 128

advertise | **not-advertise** — Specifies whether or not to advertise the summarized range of addresses into other areas. The **advertise** keyword indicates the range will be advertised, and the keyword **not-**

advertise indicates the range will not be advertised.

The default is advertise.

blackhole-aggregate

Syntax [no] blackhole-aggregate

Context config>router>ospf>area

config>router>ospf3>area

Description This command installs a low priority blackhole route for the entire aggregate. Exisiting routes that make up

the aggregate will have a higher priority and only the components of the range for which no route exists are

blackholed.

It is possible that when performing area aggregation, addresses may be included in the range for which no actual route exists. This can cause routing loops. To avoid this problem configure the blackhole aggregate

option.

The **no** form of this command removes this option.

Default blackhole-aggregate

default-metric

Syntax default-metric metric

no default-metric

Context config>router>ospf>area>stub

config>router>ospf3>area

Description This command configures the metric used by the area border router (ABR) for the default route into a stub

area.

The default metric should only be configured on an ABR of a stub area.

An ABR generates a default route if the area is a stub area.

The **no** form of the command reverts to the default value.

Default default-metric 1

Parameters metric — The metric expressed as a decimal integer for the default route cost to be advertised into the stub

area.

Values 1 — 16777215

nssa

Syntax [no] nssa

Context config>router>ospf>area

config>router>ospf3>area

Description This command creates the context to configure an OSPF or OSPF3 Not So Stubby Area (NSSA) and adds/

removes the NSSA designation from the area.

NSSAs are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is an NSSA has the capability to flood external

routes that it learns throughout its area and via an ABR to the entire OSPF or OSPF3 domain.

Existing virtual links of a non-stub or NSSA area will be removed when the designation is changed to NSSA

or stub.

An area can be designated as stub or NSSA but never both at the same time.

By default, an area is not configured as an NSSA area.

The no form of the command removes the NSSA designation and configuration context from the area.

Default no nssa — The OSPF or OSPF3 area is not an NSSA.

originate-default-route

Syntax originate-default-route [type-7]

no originate-default-route

Context config>router>ospf>area>nssa

config>router>ospf3>area>nssa

Description This command enables the generation of a default route and its LSA type (3 or 7) into a Not So Stubby Area

(NSSA) by an NSSA Area Border Router (ABR) or Autonomous System Border Router (ASBR).

When configuring an NSSA with no summaries, the ABR will inject a type 3 LSA default route into the

NSSA area. Some older implementations expect a type 7 LSA default route.

The **no** form of the command disables origination of a default route.

Default no originate-default-route — A default route is not originated.

Parameters type-7 — Specifies a type 7 LSA should be used for the default route.

Configure this parameter to inject a type-7 LSA default route instead the type 3 LSA into the NSSA

configured with no summaries.

To revert to a type 3 LSA, enter **originate-default-route** without the **type-7** parameter.

Default Type 3 LSA for the default route.

redistribute-external

Syntax [no] redistribute-external

Context config>router>ospf>area>nssa

config>router>ospf3>area>nssa

Description This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA

area border router (ABR) that is exporting the routes into non-NSSA areas.

NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF or OSPF3 areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via

an Area Border Router to the entire OSPF or OSPF3 domain.

The no form of the command disables the default behavior to automatically redistribute external routes into

the NSSA area from the NSSA ABR.

Default redistribute-external — External routes are redistributed into the NSSA.

stub

Syntax [no] stub

Context config>router>ospf>area

config>router>ospf3>area

Description This command enables access to the context to configure an OSPF or OSPF3 stub area and adds/removes the

stub designation from the area.

External routing information is not flooded into stub areas. All routers in the stub area must be configured

with the **stub** command. An OSPF or OSPF3 area cannot be both an NSSA and a stub area.

Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to

NSSA or STUB.

By default, an area is not a stub area.

The no form of the command removes the stub designation and configuration context from the area.

Default no stub — The area is not configured as a stub area.

summaries

Syntax [no] summaries

Context config>router>ospf>area>stub

config>router>ospf3>area>stub config>router>ospf>area>nssa config>router>ospf3>area>nssa

Description This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area

(NSSA) on an Area Border Router (ABR).

This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables

within the stub or NSSA area. (Default: summary)

By default, summary route advertisements are sent into the stub area or NSSA.

The no form of the command disables sending summary route advertisements and, for stub areas, only the

default route is advertised by the ABR.

Default summaries — Summary routes are advertised by the ABR into the stub area or NSSA.

Interface/Virtual Link Commands

advertise-subnet

Syntax [no] advertise-subnet

Context config>router>ospf>area>interface *ip-int-name*

Description This command enables advertising point-to-point interfaces as subnet routes (network number and mask).

When disabled, point-to-point interfaces are advertised as host routes.

The no form of the command disables advertising point-to-point interfaces as subnet routes meaning they are

advertised as host routes.

Default advertise-subnet — Advertises point-to-point interfaces as subnet routes.

authentication

Syntax authentication [inbound sa-name outbound sa-name]

authentication bidirectional sa-name

no authentication

Context config>router>ospf3>area>interface *ip-int-name*

config>router>ospf3>area>virtual-link >if

Description This command configures the password used by the OSPF3 interface or virtual-link to send and receive

OSPF3 protocol packets on the interface when simple password authentication is configured.

All neighboring routers must use the same type of authentication and password for proper protocol

communication.

By default, no authentication key is configured.

The **no** form of the command removes the authentication.

Default no authentication — No authentication is defined.

Parameters inbound sa-name — Specifies the inbound sa-name for OSPF3 authentication.

outbound sa-name — Specifies the outbound sa-name for OSPF3 authentication.

bidirectional sa-name — Specifies bidirectional OSPF3 authentication.

authentication-key

Syntax authentication-key [authentication-key | hash-key] [hash | hash2]

no authentication-key

Context config>router>ospf>area>interface *ip-int-name*

config>router>ospf>area>virtual-link >if>

Description This command configures the password used by the OSPF interface or virtual-link to send and receive OSPF

protocol packets on the interface when simple password authentication is configured.

All neighboring routers must use the same type of authentication and password for proper protocol communication. If the **authentication-type** is configured as password, then this key must be configured.

By default, no authentication key is configured.

The **no** form of the command removes the authentication key.

Default no authentication-key — No authentication key is defined.

Parameters authentication-key — The authentication key. The key can be any combination of ASCII characters up to 8

characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

hash-key — The hash key. The key can be any combination of ASCII characters up to 22 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

authentication-type

Syntax authentication-type {password | message-digest}

no authentication-type

Context config>router>ospf>area>interface *ip-int-name*

config>router>ospf>area>virtual-link router-id

Description This command enables authentication and specifies the type of authentication to be used on the OSPF

interface.

Both simple **password** and **message-digest** authentication are supported.

By default, authentication is not enabled on an interface.

The **no** form of the command disables authentication on the interface.

Configuration Commands

Default no authentication — No authentication is enabled on an interface.

Parameters password — This keyword enables simple password (plain text) authentication. If authentication is enabled

and no authentication type is specified in the command, simple **password** authentication is enabled.

message-digest — This keyword enables message digest MD5 authentication in accordance with RFC1321.

If this option is configured, then at least one message-digest-key must be configured.

bfd-enable

Syntax [no] bfd-enable

Context config>router>ospf>area>interface

Description This command enables the use of bi-directional forwarding (BFD) to control the state of the associated

protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the

BFD are set via the BFD command under the IP interface.

The **no** form of this command removes BFD from the associated IGP protocol adjacency.

Default no bfd-enable

dead-interval

Syntax dead-interval seconds

no dead-interval

Context config>router>ospf>area>interface

config>router>ospf3>area>interface config>router>ospf>area>virtual-link config>router>ospf3>area>virtual-link

Description This command configures the time, in seconds, that OSPF waits before declaring a neighbor router down. If

no hello packets are received from a neighbor for the duration of the dead interval, the router is assumed to

be down. The minimum interval must be two times the hello interval.

The no form of the command reverts to the default value.

Default 40 seconds

Special Cases OSPF Interface — If the dead-interval configured applies to an interface, then all nodes on the subnet

must have the same dead interval.

Virtual Link — If the dead-interval configured applies to a virtual link, then the interval on both

termination points of the virtual link must have the same dead interval.

Parameters *seconds* — The dead interval expressed in seconds.

Values 1 — 65535

export

Syntax [no] export policy-name [policy-name...up to 5 max]

Context config>router>ospf

Description This command configures export routing policies that determine the routes exported from the routing table

to OSPF.

If no export policy is defined, non OSPF routes are not exported from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered overrides the previous command. A maximum of five policy names can be specified.

If an **aggregate** command is also configured in the **config>router** context, then the aggregation is applied before the export policy is applied.

Routing policies are created in the **config>router>policy-options** context.

The **no** form of the command removes the specified *policy-name* or all policies from the configuration if no

policy-name is specified.

Default no export — No export policy name is specified.

Parameters policy-name — The export policy name. Up to five policy-name arguments can be specified.

export-limit

Syntax export-limit number [log percentage]

no export-limit

Context config>router>ospf

Description This command configures the maximum number of routes (prefixes) that can be exported into OSPFfrom

the route table.

The **no** form of the command removes the parameters from the configuration.

Default no export-limit, the export limit for routes or prefixes is disabled.

Parameters number — Specifies the maximum number of routes (prefixes) that can be exported into OSPF from the

route table.

Values 1 — 4294967295

log percentage — Specifies the percentage of the export-limit, at which a warning log message and SNMP

notification would be sent.

Values 1 — 100

Configuration Commands

hello-interval

Syntax hello-interval seconds

no hello-interval

Context config>router>ospf>area>interface

config>router>ospf3>area>interface config>router>ospf>area>virtual-link config>router>ospf3>area>virtual-link

Description This command configures the interval between OSPF hellos issued on the interface or virtual link.

The hello interval, in combination with the dead-interval, is used to establish and maintain the adjacency.

Use this parameter to edit the frequency that hello packets are sent.

Reducing the interval, in combination with an appropriate reduction in the associated dead-interval, allows

for faster detection of link and/or router failures at the cost of higher processing costs.

The **no** form of this command reverts to the default value.

Default hello-interval 10 — A 10-second hello interval.

Special Cases OSPF Interface — If the hello-interval configured applies to an interface, then all nodes on the subnet

must have the same hello interval.

Virtual Link — If the hello-interval configured applies to a virtual link, then the interval on both

termination points of the virtual link must have the same hello interval.

Parameters seconds — The hello interval in seconds expressed as a decimal integer.

Values 1 — 65535

interface

Syntax [no] interface ip-int-name

Context config>router>ospf>area

config>router>ospf3>area

Description This command creates a context to configure an OSPF interface.

By default, interfaces are not activated in any interior gateway protocol, such as OSPF, unless explicitly

configured.

The **no** form of the command deletes the OSPF interface configuration for this interface. The **shutdown**

command in the config>router>ospf>interface context can be used to disable an interface without removing

the configuration for the interface.

Default no interface — No OSPF interfaces are defined.

Parameters ip-int-name — The IP interface name. Interface names must be unique within the group of defined IP

interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long

composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

interface-type

Syntax interface-type {broadcast | point-to-point}

no interface-type

Context config>router>ospf>area>interface

config>router>ospf3>area>interface

Description This command configures the interface type to be either broadcast or point-to-point.

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead of the Ethernet link provided the link is used as a point-to-point.

If the interface type is not known at the time the interface is added to OSPF and subsequently the IP interface is bound (or moved) to a different interface type, this command must be entered manually.

to count (or moved) to a different interface type, this command must be entere

The **no** form of the command reverts to the default value.

Default point-to-point if the physical interface is SONET.

broadcast if the physical interface is Ethernet or unknown.

Special Cases Virtual-Link — A virtual link is always regarded as a point-to-point interface and not configurable.

Parameters broadcast — Configures the interface to maintain this link as a broadcast network. To significantly improve

adjacency forming and network convergence, a network should be configured as point-to-point if only

two routers are connected, even if the network is a broadcast media such as Ethernet.

point-to-point — Configures the interface to maintain this link as a point-to-point link.

message-digest-key

Syntax message-digest-key keyid md5 [key | hash-key] [hash]

no message-digest-key keyid

Context config>router>ospf>area>interface

config>router>ospf>area>virtual-link

Description This command configures a message digest key when MD5 authentication is enabled on the interface.

Multiple message digest keys can be configured.

The **no** form of the command removes the message digest key identified by the *key-id*.

Default No message digest keys are defined.

Configuration Commands

Parameters

keyid — The *keyid* is expressed as a decimal integer.

Values 1 — 255

md5 key — The MD5 key. The key can be any alphanumeric string up to 16 characters in length.

md5 hash-key — The MD5 hash key. The key can be any combination of ASCII characters up to 32 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

metric

Syntax metric metric

no metric

Context config>router>ospf>area>interface

config>router>ospf3>area>interface

Description This command configures an explicit route cost metric for the OSPF interface that overrides the metrics

calculated based on the speed of the underlying link.

The **no** form of the command deletes the manually configured interface metric, so the interface uses the computed metric based on the **reference-bandwidth** command setting and the speed of the underlying link.

Default no metric — The metric is based on reference-bandwidth setting and the link speed.

Parameters metric — The metric to be applied to the interface expressed as a decimal integer.

Values 1 — 65535

mtu

Syntax mtu bytes

no mtu

Context config>router>ospf>area>interfac

config>router>ospf3>area>interface

Description This command configures the OSPF packet size used on this interface. If this parameter is not configured OSPF derives the MTU value from the MTU configured (default or explicitly) in the following contexts:

config>port>ethernet

config>port>sonet-sdh>path
config>port>tdm>t3-e3

config>port>tdm>t1-e1>channel-group

If this parameter is configured, the smaller value between the value configured here and the MTU configured (default or explicitly) in an above-mentioned context is used.

To determine the actual packet size add 14 bytes for an Ethernet packet and 18 bytes for a tagged Ethernet packet to the size of the OSPF (IP) packet MTU configured in this command.

Use the **no** form of this command to revert to default.

Default

no mtu — Uses the value derived from the MTU configured in the **config>port** context.

Parameters

bytes — The MTU to be used by OSPF for this logical interface in bytes.

Values 512 — 9198 (9212 — 14) (Depends on the physical media)

passive

Syntax [no] passive

Context config>router>ospf>area>interface

config>router>ospf3>area>interface

Description This command adds the passive property to the OSPF interface where passive interfaces are advertised as

OSPF interfaces but do not run the OSPF protocol.

By default, only interface addresses that are configured for OSPF will be advertised as OSPF interfaces. The **passive** parameter allows an interface to be advertised as an OSPF interface without running the OSPF protocol.

While in passive mode, the interface will ignore ingress OSPF protocol packets and not transmit any OSPF protocol packets.

The **no** form of the command removes the passive property from the OSPF interface.

Default Service interfaces defined in **config>router>service-prefix** are passive.

All other interfaces are not passive.

priority

Syntax priority number

no priority

Context config>router>ospf>area>interface

config>router>ospf3>area>interface

Description This command configures the priority of the OSPF interface that is used in an election of the designated

router on the subnet.

This parameter is only used if the interface is of type broadcast. The router with the highest priority interface becomes the designated router. A router with priority 0 is not eligible to be Designated Router or Backup

Designated Router.

The **no** form of the command reverts the interface priority to the default value.

Configuration Commands

Default priority 1

Parameters number — The interface priority expressed as a decimal integer. A value of 0 indicates the router is not

eligible to be the Designated Router or Backup Designated Router on the interface subnet.

Values 0 - 255

retransmit-interval

Syntax retransmit-interval seconds

no retransmit-interval

Context config>router>ospf>area>interface

config>router>ospf3>area>interface config>router>ospf>area>virtual-link config>router>ospf3>area>virtual-link

Description This command specifies the length of time, in seconds, that OSPF will wait before retransmitting an

unacknowledged link state advertisement (LSA) to an OSPF neighbor.

The value should be longer than the expected round trip delay between any two routers on the attached network. Once the retransmit-interval expires and no acknowledgement has been received, the LSA will be

retransmitted.

The **no** form of this command reverts to the default interval.

Default retransmit-interval 5

Parameters seconds — The retransmit interval in seconds expressed as a decimal integer.

Values 1 — 1800

transit-delay

Syntax transit-delay seconds

no transit-delay

Context config>router>ospf>area>interface

config>router>ospf3>area>interface config>router>ospf>area>virtual-link config>router>ospf3>area>virtual-link

Description This command configures the estimated time, in seconds, that it takes to transmit a link state advertisement

(LSA) on the interface or virtual link.

The no form of this command reverts to the default delay time

Default transit-delay 1

Parameters seconds — The transit delay in seconds expressed as a decimal integer.

Values 1 — 1800

virtual-link

Syntax [no] virtual-link router-id transit-area area-id

Context config>router>ospf>area

config>router>ospf3>area

Description This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The backbone area (area 0.0.0.0) must be contiguous and all other areas must be connected to the backbone area. If it is not practical to connect an area to the backbone (see area 0.0.0.2 in the picture below) then the area border routers (routers 1 and 2 in the picture below) must be connected via a virtual link. The two area border routers will form a point-to-point like adjacency across the transit area. (area 0.0.0.1 in the picture below). A virtual link can only be configured while in the area 0.0.0.0 context.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of the command deletes the virtual link. (*Default: none specified*)

Default No virtual link is defined.

Parameters router-id — The router ID of the virtual neighbor in IP address dotted decimal notation.

transit-area *area-id* — The area-id specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

The OSPF backbone area, area 0.0.0.0, must be contiguous and all other areas must be connected to the backbone area. The backbone distributes routing information between areas. If it is not practical to connect an area to the backbone (see Area 0.0.0.5 in Figure 11) then the area border routers (such as routers Y and Z) must be connected via a virtual link. The two area border routers form a point-to-point-like adjacency across the transit area (see Area 0.0.0.4).

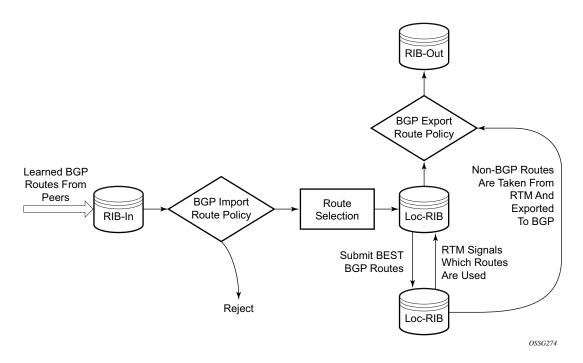

Figure 11: OSPF Areas

Show Commands

ospf

Syntax ospf [ospf-instance]

Context show>router

Description This command enables the context to display OSPF information.

Parameters *ospf-instance* — Clears the configured specified VR-ID.

Values 1 — 4294967295

area

Syntax area [area-id] [detail]

Context show>router>ospf

show>router>ospf3

Description Displays configuration information about all areas or the specified area. When detail is specified operational

and statistical information will be displayed.

Parameters area-id — The OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

detail — Displays detailed information on the area.

Output OSPF Area Output — The following table describes the standard and detailed command output fields for

an OSPF area.

Label	Description	
Area Id	A 32 bit integer uniquely identifying an area.	
Type	NSSA - This area is configured as an NSSA area.	
	Standard — This area is configured as a standard area (not NSSA or Stub).	
	Stub — This area is configured as a stub area.	
SPF Runs	The number of times that the intra-area route table has been calculated using this area's link state database.	
LSA Count	The total number of link-state advertisements in this area's link state database, excluding AS External LSA's.	

Label	Description (Continued)	
LSA Cksum Sum	The 32-bit unsigned sum of the link-state database advertisements LS checksums contained in this area's link state database. This checksum excludes AS External LSAs (type-5).	
No. of OSPF Areas	The number of areas configured on the router.	
Virtual Links	The number of virtual links configured through this transit area.	
Active IFs	The active number of interfaces configured in this area.	
Area Bdr Rtrs	The total number of ABRs reachable within this area.	
AS Bdr Rtrs	The total number of ASBRs reachable within this area.	
Last SPF Run	The time when the last intra-area SPF was run on this area.	
Router LSAs	The total number of router LSAs in this area.	
Network LSAs	The total number of network LSAs in this area.	
Summary LSAs	The summary of LSAs in this area.	
Asbr-summ LSAs	The summary of ASBR LSAs in this area.	
Nssa-ext LSAs	The total number of NSSA-EXT LSAs in this area.	
Area opaque LSAs	The total number of opaque LSAs in this area.	
Total Nbrs	The total number of neighbors in this area.	
Total IFs	The total number of interfaces configured in this area.	
Total LSAs	The sum of LSAs in this area excluding autonomous system external LSAs.	
Blackhole Range	${\tt False}$ — No blackhole route is installed for aggregates configured in this area.	
	True — A lowest priority blackhole route is installed for aggregates configured in this area.

database

Syntax database [type {router | network | summary | asbr-summary | external | nssa | all}] [area area-id] [adv-router router-id] [link-state-id] [detail]

Context show>router>ospf

show>router>ospf3

Description This command displays information about the OSPF link state database (LSDB).

When no command line options are specified, the command displays brief output for all database entries

Parameters ospf-instance — The OSPF instance.

Values 1 — 4294967295

type keyword — Specifies to filter the OSPF LSDB information based on the type specified by keyword.

type router — Display only router (Type 1) LSAs in the LSDB.

type network — Display only network (Type 2) LSAs in the LSDB.

type summary — Display only summary (Type 3) LSAs in the LSDB.

type asbr-summary — Display only ASBR summary (Type 4) LSAs in the LSDB.

type external — Display only AS external (Type 5) LSAs in the LSDB. External LSAs are maintained globally and not per area. If the display of external links is requested, the area parameter, if present, is ignored.

type nssa — Displays only NSSA area-specific AS external (Type 7) LSAs in the LSDB.

type all — Display all LSAs in the LSDB. The all keyword is intended to be used with either the **area** *area id* or the **adv-router** *router-id* [*link-state-id*] parameters.

area area-id — Display LSDB information associated with the specified OSPF area-id.

adv-router *router-id* [*link-state-id*] — Display LSDB information associated with the specified advertising router. To further narrow the number of items displayed, the *link-state-id* can optionally be specified.

detail — Displays detailed information on the LSDB entries.

Output

OSPF Database Ouput — The following table describes the standard and detailed command output fields for an OSPF database.

Label	Description
Area Id	The OSPF area identifier.
Type LSA Type	Router - LSA type of router (OSPF)
	Network - LSA type of network (OSPF)
	Summary - LSA type of summary (OSPF)
	ASBR Summary - LSA type of ASBR summary (OSPF)
	Nssa-ext - LSA area-specific, NSSA external (OSPF)
	Area opaque - LSA type of area opaque (OSPF)
	router - LSA type of router (OSPF3)
	Network - LSA type of network (OSPF3)
	IE Pfx $-$ LSA type of IE Pfx (OSPF3)IE Rtr $-$ LSA type of IE Rtr (OSPF3)
	IA Pfx - LSA type of IA Pfx (OSPF3)
	Nssa-ext - NSSA area-specific AS external (OSPF3)
Link State Id	The link state Id is an LSA type specific field containing either a number to distinguish several LSAs from the same router, an interface ID, or a router-id; it identifies the piece of the routing domain being described by the advertisement.
Adv Rtr Id Adv Router Id	The router identifier of the router advertising the LSA.
Age	The age of the link state advertisement in seconds.

Label	Description (Continued)
Sequence Sequence No	The signed 32-bit integer sequence number.
Cksum Checksum	The 32-bit unsigned sum of the link-state advertisements' LS check-sums.
No. of LSAs	The number of LSAs displayed.
Options	EA - External Attribute LSA Support
	DC - Demand Circuit Support
	R — If clear, a node can participates in OSPF topology distribution without being used to forward transit traffic.
	N - Type 7 LSA Support
	MC - Multicast Support
	E - External Routes Support
	V6 — V6 works in conjunction with R. If V6 is clear, a node can participate in OSPF topology distribution without being used to forward IPv6 datagrams. If R is set and V6 is clear, IPv6 datagrams are not forwarded but diagrams belonging to another protocol family may be forwarded.
Prefix Options	P - Propagate NSSA LSA.
	MC - Multicast support.
	LA — Lcal address capability. If set, the prefix is an IPv6 interface address of the advertising router.
	NU - No unicast capability. If set, the prefix is excluded from IPv6 unicast calculations.
Flags	None — No flags set V — The router is an endpoint for one or more fully adjacent Virtual Links having the described area as the transit area E — The router is an AS Boundary Router B — The router is an Area Border Router
Link Count	The number of links advertised in the LSA.
Link Type (n)	The link type of the <i>n</i> th link in the LSA.
Network (n)	The network address of the <i>n</i> th link in the LSA.
Metric-0 (n)	The cost metric of the n th link in the LSA.

interface

Syntax interface [ip-addr | ip-int-name | area area-id] [detail]

Context show>router>ospf show>router>ospf3

Description Displays the details of the OSPF interface, this interface can be identified by ip-address or ip interface name.

When neither is specified, all in-service interfaces are displayed.

The **detail** option produces a great amount of data. It is recommended to detail only when requesting a specific interface.

Parameters

ip-addr — Display only the interface identified by this IP address.

ip-int-name — Display only the interface identified by this interface name.

area area-id — Display all interfaces configured in this area.

detail — Displays detailed information on the interface.

Output

Standard OSPF Interface Output — The following table describes the standard command output fields for an OSPF interface.

Label	Description
If Name	The interface name.
Area Id	A 32-bit integer uniquely identifying the area to which this interface is connected. Area ID 0.0.0.0 is used for the OSPF backbone.
D Rtr Id	The IP Interface address of the router identified as the Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Designated router.
BD Rtr Id	The IP Interface address of the router identified as the Backup Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Backup Designated router.
Adm	Dn - OSPF on this interface is administratively shut down.
	Up - OSPF on this interface is administratively enabled.
Opr	Down — This is the initial interface state. In this state, the lower-level protocols have indicated that the interface is unusable.
	Wait — The router is trying to determine the identity of the (Backup) Designated router for the network.
	PTOP — The interface is operational, and connects either to a physical point-to-point network or to a virtual link.
	DR - This router is the Designated Router for this network.
	BDR - This router is the backup Designated Router for this network.
	ODR — The interface is operational and part of a broadcast or NBMA network on which another router has been selected to be the Designated Router.
No. of OSPF Interfaces	The number of interfaces listed.

Detailed OSPF Interface Output — The following table describes the detailed command output fields for an OSPF interface.

Label	Description
Interface	The IP address of this OSPF interface.
IP Address	The IP address and mask of this OSPF interface.
Interface Name	The interface name.

Label	Description (Continued)
Area Id	A 32-bit integer uniquely identifying the area to which this interface is connected. Area ID 0.0.0.0 is used for the OSPF backbone.
Priority	The priority of this interface. Used in multi-access networks, this field is used in the designated router election algorithm.
Hello Intrvl	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for all routers attached to a common network.
Rtr Dead Intrvl	The number of seconds that a router's Hello packets have not been seen before it's neighbors declare the router down. This should be some multiple of the Hello interval. This value must be the same for all routers attached to a common network.
Retrans Intrvl	The number of seconds between link-state advertisement retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description and link-state request packets.
Poll Intrvl	The larger time interval, in seconds, between the Hello packets sent to an inactive non-broadcast multi-access neighbor.
Metric	The metric to be advertised for this interface.
Advert Subnet	False — When a point-to-point interface is configured as false, then the subnet is not advertised and the endpoints are advertised as host routes.
	True — When a point-to-point interface is configured to true, then the subnet is advertised.
Transit Delay	The estimated number of seconds it takes to transmit a link state update packet over this interface.
Auth Type	Identifies the authentication procedure to be used for the packet.
	None - Routing exchanges over the network/subnet are not authenticated.
	Simple — A 64-bit field is configured on a per-network basis. All packets sent on a particular network must have this configured value in their OSPF header 64-bit authentication field. This essentially serves as a "clear" 64-bit password.
	MD5 — A shared secret key is configured in all routers attached to a common network/subnet. For each OSPF protocol packet, the key is used to generate/verify a "message digest" that is appended to the end of the OSPF packet.

Label	Description (Continued)
Passive	False — This interfaces operates as a normal OSPF interface with regard to adjacency forming and network/link behavior.
	True - no OSPF HELLOs will be sent out on this interface and the router advertises this interface as a stub network/link in its router LSAs.
MTU	The desired size of the largest packet which can be sent/received on this OSPF interface, specified in octets. This size DOES include the underlying IP header length, but not the underlying layer headers/trailers.
Admin Status	Disabled - OSPF on this interface is administratively shut down.
	Enabled - OSPF on this interface is administratively enabled.
Oper State	Down — This is the initial interface state. In this state, the lower-level protocols have indicated that the interface is unusable.
	Waiting — The router is trying to determine the identity of the (Backup) Designated router for the network.
	Point To Point — The interface is operational, and connects either to a physical point-to-point network or to a virtual link.
	Designated Rtr $-$ This router is the Designated Router for this network.
	Other Desig Rtr — The interface is operational and part of a broadcast or NBMA network on which another router has been selected to be the Designated Router.
	Backup Desig Rtr $-$ This router is the Backup Designated Router for this network.
DR-Id	The IP Interface address of the router identified as the Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Designated router
BDR-Id	The IP Interface address of the router identified as the Backup Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Backup Designated router.
IF Type	Broadcast - LANs, such as Ethernet.
	NBMA - X.25, Frame Relay and similar technologies.
	Point-To-Point — Links that are definitively point to point.
Network Type	Stub — OPSF has not established a neighbor relationship with any other OSPF router on this network as such only traffic sourced or destined to this network will be routed to this network.

Label	Description (Continued)
	Transit - OPSF has established at least one neighbor relationship with any other OSPF router on this network as such traffic en route to other networks may be routed via this network.
Oper MTU	The operational size of the largest packet which can be sent/received on this OSPF interface, specified in octets. This size DOES include the underlying IP header length, but not the underlying layer headers/trailers.
Last Enabled	The time that this interface was last enabled to run OSPF on this interface.
Nbr Count	The number of OSPF neighbors on the network for this interface.
If Events	The number of times this OSPF interface has changed its state, or an error has occurred since this interface was last enabled.
Tot Rx Packets	The total number of OSPF packets received on this interface since this interface was last enabled.
Tot Tx Packets	The total number of OSPF packets transmitted on this interface since this interface was last enabled.
Rx Hellos	The total number of OSPF Hello packets received on this interface since this interface was last enabled.
Tx Hellos	The total number of OSPF Hello packets transmitted on this interface since this interface was last enabled.
Rx DBDs	The total number of OSPF database description packets received on this interface since this interface was last enabled.
Tx DBDs	The total number of OSPF database description packets transmitted on this interface since this interface was last enabled.
Rx LSRs	The total number of Link State Requests (LSRs) received on this interface since this interface was last enabled.
Tx LSRs	The total number of Link State Requests (LSRs) transmitted on this interface since this interface was last enabled.
Rx LSUs	The total number of Link State Updates (LSUs) received on this interface since this interface was last enabled.
Tx LSUs	The total number of Link State Updates (LSUs) transmitted on this interface since this interface was last enabled.
Rx LS Acks	The total number of Link State Acknowledgements received on this interface since this interface was last enabled.
Tx LS Acks	The total number of Link State Acknowledgements transmitted on this interface since this interface was last enabled.

Label	Description (Continued)
Retransmits	The total number of OSPF Retransmits sent on this interface since this interface was last enabled.
Discards	The total number of OSPF packets discarded on this interface since this interface was last enabled.
Bad Networks	The total number of OSPF packets received with invalid network or mask since this interface was last enabled.
Bad Virt Links	The total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since this interface was last enabled.
Bad Areas	The total number of OSPF packets received with an area mismatch since this interface was last enabled.
Bad Dest Addrs	The total number of OSPF packets received with the incorrect IP destination address since this interface was last enabled.
Bad Auth Types	The total number of OSPF packets received with an invalid authorization type since this interface was last enabled.
Auth Failures	The total number of OSPF packets received with an invalid authorization key since this interface was last enabled.
Bad Neighbors	The total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since this interface was last enabled.
Bad Pkt Types	The total number of OSPF packets received with an invalid OSPF packet type since this interface was last enabled
Bad Lengths	The total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since this interface was last enabled.
Bad Hello int.	The total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since this interface was last enabled.
Bad Dead Int.	The total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since this interface was last enabled.
Bad Options	The total number of OSPF packets received with an option that does not match those configured for this interface or area since this interface was last enabled.
Bad Versions	The total number of OSPF packets received with bad OSPF version numbers since this interface was last enabled.

Label	Description (Continued)
Te Metric	Indicates the TE metric configured for this interface. This metric is flooded out in the TE metric sub-tlv in the OSPF TE LSAs. Depending on the configuration, either the TE metric value or the native OSPF metric value is used in CSPF computations.
Te State	Indicates the MPLS interface TE status from OSPF standpoint.
Admin Groups	Indicates the bit-map inherited from MPLS interface that identifies the admin groups to which this interface belongs.
Ldp Sync	Specifies whether the IGP-LDP synchronization feature is enabled or disabled on all interfaces participating in the OSPF routing protocol.
Ldp Sync Wait	Indicates the time to wait for the LDP adjacency to come up.
Ldp Timer State	Indicates the state of the LDP sync time left on the OSPF interface.
Ldp Tm Left	Indicates the time left before OSPF reverts back to advertising normal metric for this interface.

neighbor

Syntax neighbor [ip-int-name] [router-id]

Context show>router>ospf show>router>ospf3

Description This command will display all neighbor information. To reduce the amount of output the user may opt to

select the neighbors on a given interface by address or name.

The **detail** option produces a large amount of data. It is recommended to use **detail** only when requesting a specific neighbor.

Parameters

ip-int-name — Display neighbor information only for neighbors of the interface identified by the interface name

router-id — Display neighbor information for the neighbor identified by the the specified router ID.

Output

Standard OSPF Neighbor Output — The following table describes the standard command output fields for an OSPF neighbor.

Label	Description
Nbr IP Addr	The IP address this neighbor is using in its IP Source Address. Note that, on addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Nbr Rtr Id	A 32-bit integer uniquely identifying the neighboring router in the Autonomous System.
Nbr State	Down — This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor.
	Attempt — This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort should be made to contact the neighbor.
	Init — In this state, an Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (i.e., the router itself did not appear in the neighbor's Hello packet).

Label	Description (Continued)
	Two Way — In this state, communication between the two routers is bidirectional.
	ExchStart — This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial Database Descriptor sequence number.
	Exchange — In this state the router is describing its entire link state database by sending Database Description packets to the neighbor.
	Loading — In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.
	Full — In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.
Priority	The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.
RetxQ Len	The current length of the retransmission queue.
Dead Time	The time until this neighbor is declared down, this timer is set to the dead router interval when a valid hello packet is received from the neighbor.

A:ALA-A#	show router of	spf 1 neighbor	
=======		-======================================	

No. of Neighbors The number of adjacent OSPF neighbors on this interface.

Interface-Name	Rtr Id	State	Pri	RetxQ	TTL

Detailed OSPF Neighbor Output — The following table describes the detailed command output fields for an OSPF neighbor.

Label	Description
Neighbor IP Addr	The IP address this neighbor is using in its IP source address. Note that, on addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Local IF IP Addr	The IP address of this OSPF interface.
Area Id	A 32-bit integer uniquely identifying the area to which this interface is connected. Area ID 0.0.0.0 is used for the OSPF backbone
Designated Rtr	The IP Interface address of the router identified as the Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Designated router.
Neighbor Rtr Id	A 32-bit integer uniquely identifying the neighboring router in the AS.
Neighbor State	Down — This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor
	Attempt — This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort should be made to contact the neighbor.
	Init — In this state, an Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (i.e., the router itself did not appear in the neighbor's Hello packet).
	Two Way — In this state, communication between the two routers is bidirectional.
	Exchange start — This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial Database Descriptor sequence number.
	Exchange – In this state the router is describing its entire link state database by sending Database Description packets to the neighbor
	Loading — In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.
	Full — In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.

Label	Description (Continued)
Priority	The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.
Retrans Q Length	The current length of the retransmission queue.
Options	E - External Routes Support
	MC - Multicast Support
	N/P - Type 7 LSA Support
	EA - External Attribute LSA Support
	DC - Demand Circuit Support
	○ − Opaque LSA Support
Backup Desig Rtr	The IP Interface address of the router identified as the Backup Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no backup designated router.
Events	The number of times this neighbor relationship has changed state, or an error has occurred.
Last Event Time	The time when the last event occurred that affected the adjacency to the neighbor.
Up Time	This value represents the uninterrupted time, in hundredths of seconds, the adjacency to this neighbor has been up. To evaluate when the last state change occurred see last event time.
Time Before Dead	The time until this neighbor is declared down, this timer is set to the dead router interval when a valid hello packet is received from the neighbor.
Bad Nbr States	The total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since this interface was last enabled.
LSA Inst fails	The total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since this interface was last enabled.
Bad Seq Nums	The total number of times when a database description packet was received with a sequence number mismatch since this interface was last enabled.
Bad MTUs	The total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since this interface was last enabled.

Label	Description (Continued)
Bad Packets	The total number of times when an LS update was received with an illegal LS type or an option mismatch since this interface was last enabled.
LSA not in LSDB	The total number of times when an LS request was received for an LSA not installed in the LSDB of this router since this interface was last enabled.
Option Mismatches	The total number of times when a LS update was received with an option mismatch since this interface was last enabled.
Nbr Duplicates	The total number of times when a duplicate database description packet was received during the exchange state since this interface was last enabled.

----------	----------------	--------------	--------------	------------------	-------------------	----------

Context show>router>ospf

Description This command displays OSPF opaque database information.

OSPF Opaque Database Output — The following table describes the OSPF opaque database output fields.

Label	Description
Area Id	A 32-bit integer uniquely identifying an area. Area ID 0.0.0.0 is used for the OSPF backbone.
Туре	NSSA - This area is configured as a NSSA area.
	Area - This area is configured as a standard area (not NSSA or stub).
	Stub - This area is configured as a NSSA area.
Link State Id	The link state ID is an LSA type specific field containing either a Router-Id or an IP Address; it identifies the piece of the routing domain being described by the advertisement.
Adv Rtr Id	The router identifier of the router advertising the LSA.
Age	The age of the link state advertisement in seconds.

Label	Description (Continued)		
Sequence	The signed 32-bit integer sequence number.		

Cksum The 32-bit unsigned sum of the link-state advertisements' LS check-

sums.

range

Syntax range [area-id]

Context show>router>ospf show>router>ospf3

Description This command displays ranges of addresses on an Area Border Router (ABR) for the purpose of route

summarization or suppression.

Parameters area-id — Display the configured ranges for the specified area.

Output OSPF Range Output — The following table describes the OSPF range output fields.

Label	Description
Area Id	A 32-bit integer uniquely identifying an area. Area ID 0.0.0.0 is used for the OSPF backbone.
Address/Mask	The mask for the range expressed as a decimal integer mask length or in dotted decimal notation.
Advertise	${\tt False}$ — The specified address/mask is not advertised outside the area.
	True — The specified address/mask is advertised outside the area.

^{*}A:Dut-A#

Label	Description (Continued)
LSDB Type	NSSA — This range was specified in the NSSA context, and specifies that the range applies to external routes (via type-7 LSAs) learned within the NSSA when the routes are advertised to other areas as type-5 LSAs.
	Summary — This range was not specified in the NSSA context, the range applies to summary LSAs even if the area is an NSSA.

spf

Syntax spf

Context show>router>ospf

show>router>ospf3

Description This command displays statistics of shortest-path-first (SPF) calculations.

Output SPF Output Fields — The following table describes SPF output fields.

Label	Description
Total SPF Runs	The total number of incremental SPF runs triggered by new or updated LSAs.
Last Full SPF run @	The date and time when the external OSPF Dijkstra (SPF) was last run.
Last Full SPF Time	The length of time, in seconds, when the last full SPF was run.
Intra SPF Time	The time when intra-area SPF was last run on this area.
Inter SPF Time	The total number of incremental SPF runs triggered by new or updated type-3 and type-4 summary LSAs.
Extern SPF Time	The total number of incremental SPF runs triggered by new or updated type-5 external LSAs.
RTM Updt Time	The time, in hundredths of seconds, used to perform a total SPF calculation.
Min/Avg/Max Full SPF Time	 Min - The minimum time, in hundredths of seconds, used to perform a total SPF calculation. Avg - The average time, in hundredths of seconds, of all the total SPF calculations performed by this OSPF router. Max - The maximum time, in hundredths of seconds, used to perform a total SPF calculation.
Total Sum Incr SPF Runs	The total number of incremental SPF runs triggered by new or updated type-3 and type-4 summary LSAs.
Total Ext Incr SPF Runs	The total number of incremental SPF runs triggered by new or updated type-5 external LSAs.

Sample Output

A:ALA-A# show router ospf 1 spf

statistics

Syntax statistics

Context show>router>ospf

show>router>ospf3

Description This command displays the global OSPF statistics.

Output OSPF Statistics Output Fields — The following table describes the command output fields for OSPF statistics.

Label	Description
Rx Packets	The total number of OSPF packets received on all OSPF enabled interfaces.
Tx Packets	The total number of OSPF packets transmitted on all OSPF enabled interfaces.
Rx Hellos	The total number of OSPF Hello packets received on all OSPF enabled interfaces.
Tx Hellos	The total number of OSPF Hello packets transmitted on all OSPF enabled interfaces.
Rx DBDs	The total number of OSPF database description packets received on all OSPF enabled interfaces.
Tx DBDs	The total number of OSPF database description packets transmitted on all OSPF enabled interfaces
Rx LSRs	The total number of OSPF Link State Requests (LSRs) received on all OSPF enabled interfaces.
Tx LSRs	The total number of OSPF Link State Requests (LSRs) transmitted on all OSPF enabled interfaces.
Rx LSUs	The total number of OSPF Link State Update (LSUs) received on all OSPF enabled interfaces.
Tx LSUs	The total number of OSPF Link State Update (LSUs) transmitted on all OSPF enabled interfaces.
Rx LS Acks	The total number of OSPF Link State Acknowledgements (LSAs) received on all OSPF enabled interfaces.
New LSAs Recvd	The total number of new OSPF Link State Advertisements received on all OSPF enabled interfaces.
New LSAs Orig	The total number of new OSPF Link State Advertisements originated on all OSPF enabled interfaces.
Ext LSAs Count	The total number of OSPF External Link State Advertisements.

Label	Description		
No of Areas	The number of areas configured for this OSPF instance.		
Total SPF Runs	The total number of incremental SPF runs triggered by new or updated LSAs.		
Ext SPF Runs	The total number of incremental SPF runs triggered by new or updated type-5 external LSAs.		
Retransmits	The total number of OSPF Retransmits transmitted on all OSPF enabled interfaces.		
Discards	The total number of OSPF packets discarded on all OSPF enabled interfaces.		
Bad Networks	The total number of OSPF packets received on all OSPF enabled interfaces with invalid network or mask.		
Bad Virt Links	The total number of OSPF packets received on all OSPF enabled interfaces that are destined to a virtual link that does not exist.		
Bad Areas	The total number of OSPF packets received on all OSPF enabled interfaces with an area mismatch		
Bad Dest Addrs	The total number of OSPF packets received on all OSPF enabled interfaces with the incorrect IP destination address.		
Bad Auth Types	The total number of OSPF packets received on all OSPF enabled interfaces with an invalid authorization type.		
Auth Failures	The total number of OSPF packets received on all OSPF enabled interfaces with an invalid authorization key.		
Bad Neighbors	The total number of OSPF packets received on all OSPF enabled interfaces where the neighbor information does not match the information this router has for the neighbor.		
Bad Pkt Types	The total number of OSPF packets received on all OSPF enabled interfaces with an invalid OSPF packet type.		
Bad Lengths	The total number of OSPF packets received on all OSPF enabled interfaces with a total length not equal to the length given in the packet itself.		
Bad Hello Int.	The total number of OSPF packets received on all OSPF enabled interfaces where the hello interval given in packet was not equal to that configured for the respective interface.		
Bad Dead Int.	The total number of OSPF packets received on all OSPF enabled interfaces where the dead interval given in the packet was not equal to that configured for the respective interface.		

Label	Description
Bad Options	The total number of OSPF packets received on all OSPF enabled interfaces with an option that does not match those configured for the respective interface or area.
Bad Versions	The total number of OSPF packets received on all OSPF enabled interfaces with bad OSPF version numbers.

status

Syntax status

Context show>router>ospf

show>router>ospf3

Description Displays the general status of OSPF.

Output OSPF Status Output Fields — The following table describes the command output fields for OSPF status.

Label	Description
OSPF Router Id	A 32-bit integer uniquely identifying the router in the Autonomous System. The 7750 SR-Series defaults to the System IP address or if not configured the 32 least significant bits of the system MAC address.
OSPF Version	The current version number of the OSPF protocol is 2.
OSPF Admin Status	Disabled — Denotes that the OSPF process is disabled on all interfaces. Enabled — Denotes that the OSPF process is active on at least one interface.
OSPF Oper Status	Disabled — Denotes that the OSPF process is not operational on all interfaces. Enabled — Denotes that the OSPF process is operational on at least one interface.
Preference	The route preference for OSPF internal routes.
External Prefer- ence	The route preference for OSPF external routes.
Backbone Router	${\tt False}$ — This variable indicates that this router is not configured as an OSPF back bone router.
	True — This variable indicates that this router is configured as an OSPF back bone router.
Area Border Router	False - This router is not an area border router.
	True - This router is an area border router.
AS Border Router	False — This router is not configured as an Autonomous System border router.
	True - This router is configured as an Autonomous System border router.
OSPF Ldp Sync Admin Status	Indicates whether the IGP-LDP synchronization feature is enabled or disabled on all interfaces participating in the OSPF routing protocol.

virtual-link

Syntax virtual-link [detail]

Context show>router>ospf

show>router>ospf3

Description This command displays information for OSPF virtual links.

Parameters detail — Provides operational and statistical information about virtual links associated with this router.

Output OSPF Virtual Link Output — The following table describes OSPF virtual-link output fields.

Label	Description
Nbr Rtr ID	The router ID(s) of neighboring routers.
Area Id	A 32-bit integer which identifies an area.
Local Interface	The IP address of the local egress interface used to maintain the adjacency to reach this virtual neighbor.
Metric	The metric value associated with the route. This value is used when importing this static route into other protocols. When the metric is configured as zero then the metric configured in OSPF, default-importmetric, applies. This value is also used to determine which static route to install in the forwarding table.
State	The operational state of the virtual link to the neighboring router.
Authentication	Specifies whether authentication is enabled for the interface or virtual link.
Hello Intrval	Specifies the length of time, in seconds, between the Hello packets that the router sends on the interface.
Rtr Dead Intrvl	Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was enabled.
Tot Rx Packets	Specifies the total number of OSPF packets received on this interface since the OSPF admin status was enabled.
Rx Hellos	Specifies the total number of OSPF Hello packets received on this interface since the OSPF admin status was enabled.
Rx DBDs	Specifies the total number of OSPF DataBase Description packets received on this interface since the OSPF administrative status was enabled.
Rx LSRs	Specifies the total number of Link State Requests (LSRs) received on this interface since the OSPF admin status was enabled.

Label	Description (Continued)
Rx LSUs	Specifies the total number of Link State Updates (LSUs) received on this interface since the OSPF admin status was enabled.
Rx LS Acks	Specifies the total number of Link State Acknowledgements received on this interface since the OSPF admin status was enabled.
Tot Tx Packets	Specifies the total number of OSPF packets transmitted on this virtual interface since it was created.
Tx Hellos	Specifies the total number of OSPF Hello packets transmitted on this virtual interface since it was created.
Tx DBDs	Specifies the total number of OSPF database description packets transmitted on this virtual interface.
Tx LSRs	Specifies the total number of OSPF Link State Requests (LSRs) transmitted on this virtual interface.
Tx LSUs	Specifies the total number of OSPF Hello packets transmitted on this interface since the OSPF admin status was enabled.
Tx LS Acks	Specifies the total number of OSPF Link State Acknowledgements (LSA) transmitted on this virtual interface.
Retransmits	Specifies the total number of OSPF retransmits sent on this interface since the OSPF admin status was last enabled.
Discards	Specifies the total number of OSPF packets discarded on this interface since the OSPF admin status was last enabled.
Bad Networks	Specifies the total number of OSPF packets received with invalid network or mask since the OSPF admin status was last enabled.
Bad Versions	Specifies the total number of OSPF packets received with bad OSPF version numbers since the OSPF admin status was last enabled.
Bad Areas	Specifies the total number of OSPF packets received with an area mismatch since the OSPF admin status was last enabled.
Bad Dest Addrs	Specifies the total number of OSPF packets received with the incorrect IP destination address since the OSPF admin status was last enabled.
Bad Auth Types	Specifies the total number of OSPF packets received with an invalid authorization type since the OSPF admin status was last enabled.
Auth Failures	Specifies the total number of OSPF packets received with an invalid authorization key since the OSPF admin status was last enabled.
Bad Neighbors	Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled.

Label	Description (Continued)
Bad Pkt Types	Specifies the total number of OSPF packets received with an invalid OSPF packet type since the OSPF admin status was last enabled.
Bad Lengths	Specifies the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since the OSPF admin status was last enabled.
Bad Hello Int.	Specifies the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since the OSPF admin status was last enabled.
Bad Dead Int.	Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was last enabled.
Bad Options	Specifies the total number of OSPF packets received with an option that does not match those configured for this interface or area since the OSPF admin status was last enabled.
Retrans Intrvl	Specifies the length of time, in seconds, that OSPF waits before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor.
Transit Delay	Specifies the time, in seconds, that it takes to transmit a link state advertisement (LSA) on the interface or virtual link.
Last Event	Specifies the date and time when an event was last associated with this OSPF interface.

virtual-neighbor

Syntax virtual-neighbor [remote router-id] [detail]

Context show>router>ospf

show>router>ospf3

Description This command displays virtual neighbor information.

Parameters remote *router-id* — Displays the specified router ID. This reduces the amount of output displayed.

detail — Produces detailed information on the virtual neighbor. This option produces a large amount of data. It is recommended to use **detail** only when requesting information for a specific neighbor.

Output OSPF Virtual Neighbor Output — The following table describes OSPF virtual neighbor output fields.

Label	Description
Nbr IP Addr	The IP address this neighbor is using in its IP source address. Note that, on addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Nbr Rtr ID	Specifies the router ID(s) of neighboring routers.
Transit Area	Specifies the transit area ID that links the backbone area with the area that has no physical connection with the backbone.
Retrans Q Length	The current length of the retransmission queue.
No. of Neighbors	Specifies the total number of OSPF neighbors adjacent on this interface, in a state of INIT or greater, since the OSPF admin status was enabled.
Nbr State	Specifies the operational state of the virtual link to the neighboring router.
Options	Specifies the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit area since the OSPF admin status was enabled.
Events	Specifies the total number of events that have occurred since the OSPF admin status was enabled.
Last Event Time	Specifies the date and time when an event was last associated with this OSPF interface.
Up Time	Specifies the uninterrupted time, in hundredths of seconds, the adjacency to this neighbor has been up.
Time Before Dead	Specifies the amount of time, in seconds, until the dead router interval expires.
Bad Nbr States	Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled.

Label	Description (Continued)
LSA Inst fails	Specifies the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since the OSPF admin status was last enabled.
Bad Seq Nums	Specifies the total number of times when a database description packet was received with a sequence number mismatch since the OSPF admin status was last enabled.
Bad MTUs	Specifies the total number of times when the MTU in a received data- base description packet was larger than the MTU of the receiving inter- face since the OSPF admin status was enabled.
Bad Packets	Specifies the total number of times when an LS update was received with an illegal LS type or an option mismatch since the OSPF admin status was enabled.
LSA not in LSDB	Specifies the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since the OSPF admin status was enabled.
Option Mismatches	Specifies the total number of times when a LS update was received with an option mismatch since the OSPF admin status was enabled.
Nbr Duplicates	Specifies the total number of times when a duplicate database description packet was received during the Exchange state since the OSPF admin status was enabled.

Clear Commands

ospf

Syntax ospf [ospf-instance]

Context clear>router

Description This command clears and resets OSPF protocol entities.

Parameters *ospf-instance* — Clears the configured specified VR-ID.

Values 1 — 4294967295

database

Syntax database [purge]

Context clear>router>ospf

clear>router>ospf3

Description This command clears all LSAs received from other nodes.

Sets all adjacencies better then two way to one way.

Refreshes all self originated LSAs

Parameters purge — The purge parameter also clears all self-originated LSAs and re-originates all self-originated LSAs

export

Syntax export

Context clear>router>ospf

clear>router>ospf3

Description Re-evaluates all effective export policies

neighbor

Syntax neighbor [ip-int-name | ip-address]

Context clear>router>ospf

clear>router>ospf3

Description Marks the neighbor as dead and re-initiates the affected adjacencies.

Parameters *ip-int-name* — Clear all neighbors for the interface specified by this interface name.

ip-address — Clear all neighbors for the interface specified by this IP-address

statistics

Syntax statistics

Context clear>router>ospf

clear>router>ospf3

Description Clears all neighbor, router, interface, SPF and global statistics of this OSPF instance.

OSPF Debug Commands

ospf

Syntax ospf [ospf-instance]

Context debug>router

Description Indicates the OSPF instance for debugging purposes.

Parameters *ospf-instance* — The OSPF instance.

Values 1 — 31

area

Syntax area [area-id]

no area

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an OSPF area.

Parameters area-id — Specify the OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

area-range

Syntax area-range [ip-address]

no area-range

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an OSPF area range.

Parameters ip-address — Specify the IP address for the range used by the ABR to advertise the area into another area.

cspf

Syntax cspf [ip-address]

no cspf

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an OSPF constraint-based shortest path first (CSPF).

Parameters *ip-address* — Specify the IP address for the range used for CSPF.

graceful-restart

Syntax [no] graceful-restart

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for OSPF and OSPF3 graceful-restart.

interface

Syntax interface [ip-int-name | ip-address]

no interface

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an OSPF and OSPF3 interface.

Parameters *ip-int-name* — Specify the IP interface name. An interface name cannot be in the form of an IP address.

Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII

characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed

within double quotes.

ip-address — Specify the interface's IP address.

leak

Syntax leak [ip-address]

no leak

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for OSPF leaks.

OSPF Debug Commands

Parameters *ip-address* — Specify the IP address to debug OSPF leaks.

Isdb

Syntax | Isdb [type] [/s-id] [adv-rtr-id] [area area-id]

no Isdb

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an OSPF link-state database (LSDB).

Parameters *type* — Specifies the OSPF link-state database (LSDB) type.

Values router, network, summary, asbr, extern, nssa, area-opaque, as-opaque, link-opaque

ls-id — Specifies an LSA type specific field containing either a router ID or an IP address. It identifies the

piece of the routing domain being described by the advertisement.

adv-rtr-id — Specifies the router identifier of the router advertising the LSA.

area-id — Specifies a 32-bit integer uniquely identifying an area.

misc

Syntax [no] misc

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for miscellaneous OSPF events.

neighbor

Syntax neighbor [ip-int-name | ip-address]

no neighbor

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an OSPF or OSPF3 neighbor.

Parameters *ip-int-name* — Specifies the neighbor interface name.

ip-address — Specifies neighbor information for the neighbor identified by the specified router ID.

nssa-range

Syntax nssa-range [ip-address]

no nssa-range

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for an NSSA range.

Parameters *ip-address* — Specifies the IP address range to debug.

packet

Syntax packet [packet-type] [ip-address]

no packet

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for OSPF packets.

Parameters packet-type — Specifies the OSPF packet type to debug.

Values hello, dbdescr, lsrequest, lsupdate, lsack

ip-address — Specifies the IP address to debug.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

rtm

Syntax rtm [ip-address]

no rtm

Context debug>router>ospf

debug>router>ospf3

Description This command enables debugging for OSPF RTM.

Parameters *ip-address* — Specifies the IP address to debug.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

OSPF Debug Commands

spf

Syntax spf [type] [dest-addr]

no spf

Context debug>router>ospf

Description This command enables debugging for OSPF SPF. Information regarding overall SPF start and stop times

will be shown. To see detailed information regarding the SPF calculation of a given route, the route must be

specified as an optional argument.

Parameters *type* — Specifies the area to debug

Values intra-area, inter-area, external

dest-addr — Specifies the destination IP address to debug.

virtual-neighbor

Syntax virtual-neighbor [ip-address]

no virtual-neighbor

Context debug>router>ospf

Description This command enables debugging for an OSPF virtual neighbor.

Parameters *ip-address* — Specifies the IP address of the virtual neighbor.

In This Chapter

This chapter provides information to configure Intermediate System to Intermediate System (IS-IS).

Topics in this chapter include:

 - IS-IS Route Summarization on page 423
 - IS-IS Multi-Topology for IPv6 on page 424
 - IS-IS Administrative Tags on page 425
- IS-IS Configuration Process Overview on page 427
- Configuration Notes on page 428

Configuring IS-IS

Intermediate-system-to-intermediate-system (IS-IS) is a link-state interior gateway protocol (IGP) which uses the Shortest Path First (SPF) algorithm to determine routes. Routing decisions are made using the link-state information. IS-IS evaluates topology changes and, if necessary, performs SPF recalculations.

Entities within IS-IS include networks, intermediate systems, and end systems. In IS-IS, a network is an autonomous system (AS), or routing domain, with end systems and intermediate systems. A router, such as a 7750 SR-Series router, is an intermediate system. End systems are network devices which send and receive protocol data units (PDUs), the OSI term for packets. Intermediate systems send, receive, and forward PDUs.

End system and intermediate system protocols allow routers and nodes to identify each other. IS-IS sends out link-state updates periodically throughout the network, so each router can maintain current network topology information.

IS-IS supports large ASs by using a two-level hierarchy. A large AS can be administratively divided into smaller, more manageable areas. A system logically belongs to one area. Level 1 routing is performed within an area. Level 2 routing is performed between areas. 7750 SR-Series routers can be configured as Level 1, Level 2, or both Level 1/2.

Figure 12 displays an example of an IS-IS routing domain.

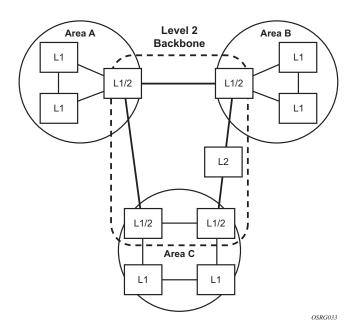

Figure 12: IS-IS Routing Domain

Routing

OSI IS-IS routing uses two-level hierarchical routing. A routing domain can be partitioned into areas. Level 1 routers know the topology in their area, including all routers and end systems in their area but do not know the identity of routers or destinations outside of their area. Level 1 routers forward traffic with destinations outside of their area to a Level 2 router in their area.

Level 2 routers know the Level 2 topology, and know which addresses are reachable by each Level 2 router. Level 2 routers do not need to know the topology within any Level 1 area, except to the extent that a Level 2 router can also be a Level 1 router within a single area. By default, only Level 2 routers can exchange PDUs or routing information directly with external routers located outside the routing domain.

In IS-IS, there are two types of routers:

- Level 1 intermediate systems Routing is performed based on the area ID portion of the ISO address called the *network entity title* (NET). Level 1 systems route within an area. They recognize, based on the destination address, whether the destination is within the area. If so, they route toward the destination. If not, they route to the nearest Level 2 router.
- Level 2 intermediate systems Routing is performed based on the area address. They route toward other areas, disregarding other area's internal structure. A Level 2 intermediate system can also be configured as a Level 1 intermediate system in the same area.

The Level 1 router's area address portion is manually configured (see ISO Network Addressing on page 420). A Level 1 router will not become a neighbor with a node that does not have a common area address. However, if a Level 1 router has area addresses A, B, and C, and a neighbor has area addresses B and D, then the Level 1 router will accept the other node as a neighbor, as address B is common to both routers. Level 2 adjacencies are formed with other Level 2 nodes whose area addresses do not overlap. If the area addresses do not overlap, the link is considered by both routers to be Level 2 only and only Level 2 LSPDUs flow on the link.

Within an area, Level 1 routers exchange LSPs which identify the IP addresses reachable by each router. Specifically, zero or more IP address, subnet mask, and metric combinations can be included in each LSP. Each Level 1 router is manually configured with the IP address, subnet mask, and metric combinations, which are reachable on each interface. A Level 1 router routes as follows:

- If a specified destination address matches an IP address, subnet mask, or metric reachable within the area, the PDU is routed via Level 1 routing.
- If a specified destination address does not match any IP address, subnet mask, or metric combinations listed as reachable within the area, the PDU is routed towards the nearest Level 2 router.

Configuring IS-IS

Level 2 routers include in their LSPs, a complete list of IP address, subnet mask, and metrics specifying all the IP addresses which reachable in their area. This information can be obtained from a combination of the Level 1 LSPs (by Level 1 routers in the same area). Level 2 routers can also report external reachability information, corresponding to addresses reachable by routers in other routing domains or autonomous systems.

IS-IS Frequently Used Terms

- Area An area is a routing sub-domain which maintains detailed routing information about its own internal composition, and also maintains routing information which allows it to reach other routing sub-domains. Areas correspond to the Level 1 sub-domain.
- End system End systems send NPDUs to other systems and receive NPDUs from other systems, but do not relay NPDUs. This International Standard does not specify any additional end system functions beyond those supplied by ISO 8473 and ISO 9542.
- Neighbor A neighbor is an adjacent system reachable by traversing a single subnetwork by a PDU.
- Adjacency An adjacency is a portion of the local routing information which pertains to
 the reachability of a single neighboring end or intermediate system over a single circuit.
 Adjacencies are used as input to the decision process to form paths through the routing
 domain. A separate adjacency is created for each neighbor on a circuit and for each level
 of routing (Level 1 and Level 2) on a broadcast circuit.
- Circuit The subset of the local routing information base pertinent to a single local Subnetwork Point of Attachments (SNPAs).
- Link The communication path between two neighbors. A link is up when communication is possible between the two SNPAs.
- Designated IS The intermediate system on a LAN which is designated to perform
 additional duties. In particular, the designated IS generates link-state PDUs on behalf of
 the LAN, treating the LAN as a pseudonode.
- Pseudonode Where a broadcast sub-network has *n* connected intermediate systems, the broadcast sub-network itself is considered to be a pseudonode. The pseudonode has links to each of the *n* intermediate systems and each of the ISs has a single link to the pseudonode (rather than *n*-1 links to each of the other intermediate systems). Link-state PDUs are generated on behalf of the pseudonode by the designated IS.
- Broadcast sub-network A multi-access subnetwork that supports the capability of addressing a group of attached systems with a single PDU.
- General topology sub-network A topology that is modeled as a set of point-to-point links, each of which connects two systems. There are several generic types of general topology subnetworks, multipoint links, permanent point-to-point links, dynamic and static point-to-point links.
- Routing sub-domain A routing sub-domain consists of a set of intermediate systems and end systems located within the same routing domain.
- Level 2 sub-domain Level 2 sub-domain is the set of all Level 2 intermediate systems in a routing domain.

ISO Network Addressing

IS-IS uses ISO network addresses. Each address identifies a point of connection to the network, such as a router interface, and is called a Network Service Access Point (NSAP).

An end system can have multiple NSAP addresses, in which case the addresses differ only by the last byte (called the *n-selector*). Each NSAP represents a service that is available at that node. In addition to having multiple services, a single node can belong to multiple areas.

Each network entity has a special network address called a Network Entity Title (NET). Structurally, an NET is identical to an NSAP address but has an n-selector of 00. Most end systems have one NET. Intermediate systems can have up to three area IDs (area addresses).

NSAP addresses are divided into three parts. Only the area ID portion is configurable.

- Area ID A variable length field between 1 and 13 bytes long. This includes the Authority and Format Identifier (AFI) as the most significant byte and the area ID.
- System ID A six-byte system identification. This value is not configurable. The system ID is derived from the system or router ID.
- Selector ID A one-byte selector identification that must contain zeros when configuring a NET. This value is not configurable. The selector ID is always 00.

Of the total 20 bytes comprising the NET, only the first 13 bytes, the area ID portion, can be manually configured. As few as one byte can be entered or, at most, 13 bytes. If less than 13 bytes are entered, the rest is padded with zeros.

Routers with common area addresses form Level 1 adjacencies. Routers with no common NET addresses form Level 2 adjacencies, if they are capable (Figure 13).

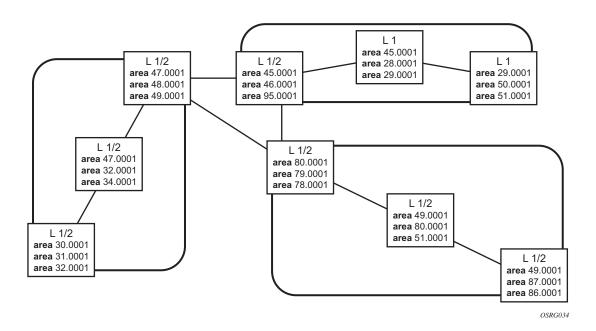

Figure 13: Using Area Addresses to Form Adjacencies

IS-IS PDU Configuration

The following PDUs are used by IS-IS to exchange protocol information:

- IS-IS hello PDU Routers with IS-IS enabled send hello PDUs to IS-IS-enabled interfaces to discover neighbors and establish adjacencies.
- Link-state PDUs Contain information about the state of adjacencies to neighboring IS-IS systems. LSPs are flooded periodically throughout an area.
- Complete sequence number PDUs In order for all routers to maintain the same information, CSNPs inform other routers that some LSPs can be outdated or missing from their database. CSNPs contain a complete list of all LSPs in the current IS-IS database.
- Partial sequence number PDUs (PSNPs) PSNPs are used to request missing LSPs and acknowledge that an LSP was received.

IS-IS Operations

7750 SR-Series routers perform IS-IS routing as follows:

- Hello PDUs are sent to the IS-IS-enabled interfaces to discover neighbors and establish adjacencies.
- IS-IS neighbor relationships are formed if the hello PDUs contain information that meets the criteria for forming an adjacency.
- SRs can build a link-state PDU based upon their local interfaces that are configured for IS-IS and prefixes learned from other adjacent routers.
- SRs flood LSPs to the adjacent neighbors except the neighbor from which they received the same LSP. The link-state database is constructed from these LSPs.
- A Shortest Path Tree (SPT) is calculated by each IS, and from this SPT the routing table is built.

IS-IS Route Summarization

IS-IS IPv4 route summarization allows users to create aggregate IPv4 addresses that include multiple groups of IPv4 addresses for a given IS-IS level. IPv4 Routes redistributed from other routing protocols also can be summarized. It is similar to the OSPF area-range command. IS-IS IPv4 route summarization helps to reduce the size of the LSDB and the IPv4 routing table, and it also helps to reduce the chance of route flapping.

IPv4 route summarization supports:

- Level 1, Level 1-2, and Level 2
- Route summarization for the IPv4 routes redistributed from other protocols
- Metric used to advertise the summary address will be the smallest metric of all the more specific IPv4 routes.

IS-IS Multi-Topology for IPv6

IS-IS IPv6 TLVs for IPv6 routing is supported in the 7750 SR-Series. This is considered native IPv6 routing with IS-IS. It has a limitation that IPv4 and IPv6 topologies must be congruent, otherwise traffic may be black holed. Service providers should ensure that the IPv4 topology and IPv6 topology are the same. With the 7750 SR-Series IS-IS multi-topology service providers can use different topologies for IPv4 and IPv6.

The implementation is compliant with draft-ietf-isis-wg-multi-topology-xx.txt, *M-ISIS: Multi Topology (MT) Routing in IS-IS.*

The following MT topologies are supported:

- MT ID #0: Equivalent to the standard IS-IS topology.
- MT ID #2: Reserved for IPv6 routing topology

IS-IS Administrative Tags

IS-IS admin tags enable a network administrator to configure route tags to tag IS-IS route prefixes. These tags can subsequently be used to control Intermediate System-to-Intermediate System (IS-IS) route redistribution or route leaking.

The IS-IS support for route tags allows the tagging of IP addresses of an interface and use the tag to apply administrative policy with a route map. A network administrator can also tag a summary route and then use a route policy to match the tag and set one or more attributes for the route.

Using these administrative policies allow the operator to control how a router handles the routes it receives from and sends to its IS-IS neighboring routers. Administrative policies are also used to govern the installation of routes in the routing table.

Route tags allow:

- Policies to redistribute routes received from other protocols in the routing table to IS-IS.
- Policies to redistribute routes between levels in an IS-IS routing hierarchy.
- Policies to summarize routes redistributed into IS-IS or within IS-IS by creating aggregate (summary) addresses.

Setting Route Tags

IS-IS route tags are configurable in the following ways:

- Setting a route tag for an IS-IS interface.
- Setting a route tag on an IS-IS passive interface.
- Setting a route tag for a route redistributed from another protocol to IS-IS.
- Setting a route tag for a route redistributed from one IS-IS level to another IS-IS level.
- Setting a route tag for an IS-IS default route.
- Setting a route tag for an IS-IS summary address.

Using Route Tags

Although an operator on this or another (neighboring) IS-IS router has configured setting of the IS-IS administrative tags it will not have any effect unless policies are configure to instruct how to process the given tag value.

Policies can process tags where ISIS is either the origin, destination or both origin and destination protocol.

IS-IS Configuration Process Overview

Figure 14 displays the process to provision basic IS-IS parameters.

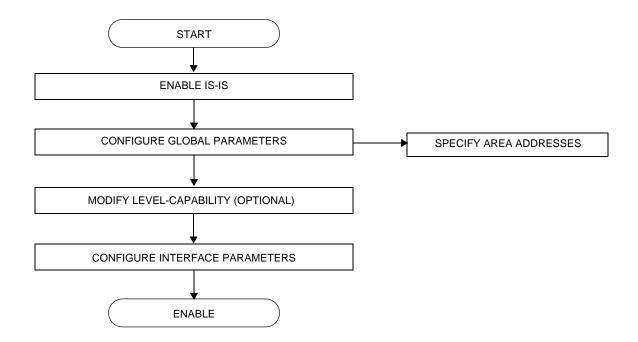

Figure 14: IS-IS Configuration and Implementation Flow

Configuration Notes

This section describes IS-IS configuration caveats.

General

- IS-IS must be enabled on each participating SR-Series .
- There are no default network entity titles.
- There are no default interfaces.
- By default, SR-Series routers are assigned a Level 1/Level 2 level capability.

Configuring IS-IS with CLI

This section provides information to configure intermediate-system-to-intermediate-system (IS-IS) using the command line interface.

Topics in this section include:

- IS-IS Configuration Overview on page 430
 - → Router Levels on page 430
 - → Area Address Attributes on page 430
 - → Interface Level Capability on page 431
 - → Route Leaking on page 432
- Basic IS-IS Configuration on page 433

IS-IS Configuration Overview

Router Levels

The router's level capability can be configured globally and on a per-interface basis. The interface-level parameters specify the interface's routing level. The neighbor capability and parameters define the adjacencies that are established.

IS-IS is not enabled by default. When IS-IS is enabled, the global default level capability is Level 1/2 which enables the router to operate as either a Level 1 and/or a Level 2 router with the associated databases. The router runs separate shortest path first (SPF) calculations for the Level 1 area routing and for the Level 2 multi-area routing to create the IS-IS routing table.

The level value can be modified on both or either of the global and interface levels to be only Level 1-capable, only Level 2-capable or Level 1 *and* Level 2-capable.

If the default value is not modified on any routers in the area, then the routers try to form both Level 1 and Level 2 adjacencies on all IS-IS interfaces. If the default values are modified to Level 1 or Level 2, then the number of adjacencies formed are limited to that level only.

Area Address Attributes

The area-id command specifies the area address portion of the NET which is used to define the IS-IS area to which the router will belong. At least one area-id command should be configured on each router participating in IS-IS. A maximum of three area-id commands can be configured per router.

The area address identifies a point of connection to the network, such as a router interface, and is called a *network service access point (NSAP)*. The routers in an area manage routing tables about destinations within the area. The Network Entity Title (NET) value is used to identify the IS-IS area to which the router belongs.

NSAP addresses are divided into three parts. Only the Area ID portion is configurable.

- 1. Area ID A variable length field between 1 and 13 bytes long. This includes the Authority and Format Identifier (AFI) as the most significant byte and the area ID.
- 2. System ID A six-byte system identification. This value is not configurable. The system ID is derived from the system or router ID.
- 3. Selector ID A one-byte selector identification that must contain zeros when configuring a NET. This value is not configurable. The selector ID is always 00.

The following example displays ISO addresses in IS-IS address format:

Interface Level Capability

The level capability value configured on the interface level is compared to the level capability value configured on the global level to determine the type of adjacencies that can be established. The default level capability for 7750 SR-Series routers and interfaces is Level 1/2.

Table 12 displays configuration combinations and the potential adjacencies that can be formed.

Table 12: Potential Adjacency Capabilities

Global Level	Interface Level	Potential Adjacency
L 1/2	L 1/2	Level 1 and/or Level 2
L 1/2	L 1	Level 1 only
L 1/2	L 2	Level 2 only
L 2	L 1/2	Level 2 only
L 2	L 2	Level 2 only
L 2	L 1	none
L 1	L 1/2	Level 1 only
L 1	L 2	none
L 1	L 1	Level 1 only

Route Leaking

Alcatel-Lucent's implementation of IS-IS route leaking is performed in compliance with RFC 2966, *Domain-wide Prefix Distribution with Two-Level IS-IS*. As previously stated, IS-IS is a routing domain (an autonomous system running IS-IS) which can be divided into Level 1 areas with a Level 2-connected subset (backbone) of the topology that interconnects all of the Level 1 areas. Within each Level 1 area, the routers exchange link state information. Level 2 routers also exchange Level 2 link state information to compute routes between areas.

Routers in a Level 1 area typically only exchange information within the Level 1 area. For IP destinations not found in the prefixes in the Level 1 database, the Level 1 router forwards PDUs to the nearest router that is in both Level 1/Level 2 with the *attached bit* set in its Level 1 link-state PDU.

There are many reasons to implement domain-wide prefix distribution. The goal of domain-wide prefix distribution is to increase the granularity of the routing information within the domain. The routing mechanisms specified in RFC 1195 are appropriate in many situations and account for excellent scalability properties. However, in certain circumstances, the amount of scalability can be adjusted which can distribute more specific information than described by RFC 1195.

Distributing more prefix information can improve the quality of the resulting routes. A well known property of default routing is that loss of information can occur. This loss of information affects the computation of a route based upon less information which can result in sub-optimal routes.

Basic IS-IS Configuration

For IS-IS to operate on 7750 SR-Series routers, IS-IS must be explicitly enabled, and at least one area address and interface must be configured. If IS-IS is enabled but no area address or interface is defined, the protocol is enabled but no routes are exchanged. When at least one area address and interface are configured, then adjacencies can be formed and routes exchanged.

To configure IS-IS, perform the following tasks:

- Enable IS-IS.
- If necessary, modify the level capability on the global level (default is level-1/2).
- Define area address(es)
- Configure IS-IS interfaces.

The following output displays IS-IS default values.

```
A:Dut-A>config>router>isis$ info detail
       level-capability level-1/2
       no graceful-restart
       area-id 01
       no authentication-key
       no authentication-type
       authentication-check
       csnp-authentication
       lsp-lifetime 1200
       no export
       hello-authentication

hello-authentication
preference 18
psnp-authentication
no wide-metrics-only
exit
no shutdown
```

A:Dut-A>config>router>isis\$

Common Configuration Tasks

To implement IS-IS in your network, you must enable IS-IS on each participating 7750 SR-Series router.

To assign different level capabilities to the routers and organize your network into areas, modify the level capability defaults on end systems from Level 1/2 to Level 1. Routers communicating to other areas can retain the Level 1/2 default.

On each router, at least one area ID also called the area address should be configured as well as at least one IS-IS interface.

- Enable IS-IS.
- Configure global IS-IS parameters.
 - → Configure area address(es).
- Configure IS-IS interface-specific parameters.

Configuring IS-IS Components

Use the CLI syntax displayed below for:

- Enabling IS-IS on page 436
- Modifying Router-Level Parameters on page 436
- Configuring ISO Area Addresses on page 438
- Configuring Global IS-IS Parameters on page 439
- Configuring Interface Parameters on page 444
- Example: Configuring a Level 1 Area on page 446
- Example: Modifying a Router's Level Capability on page 448

Enabling IS-IS

IS-IS must be enabled in order for the protocol to be active.

NOTE: Careful planning is essential to implement commands that can affect the behavior of global and interface levels.

To configure IS-IS on a router, enter the following command:

CLI Syntax: isis

Example: config>router# isis

Modifying Router-Level Parameters

When IS-IS is enabled, the default level-capability is Level 1/2. This means that the router operates with both Level 1 and Level 2 routing capabilities. To change the default value in order for the router to operate as a Level 1 router or a Level 2 router, you must explicitly modify the level value.

If the level is modified, the protocol shuts down and restarts. Doing this can affect adjacencies and routes.

The level-capability value can be configured on the global level and also on the interface level. The level-capability value determines which level values can be assigned on the router level or on an interface-basis.

In order for the router to operate as a Level 1 only router or as a Level 2 only router, you must explicitly specify the <code>level-number</code> value.

- Select level-1 to route only within an area.
- Select level-2 to route to destinations outside an area, toward other eligible Level 2 routers.

To configure the router level, enter the following commands:

The following example displays the configuration:

Configuring ISO Area Addresses

Use the following CLI syntax to configure an area ID also called an address. A maximum of 3 area-id can be configured.

The following example configures the router's area ID:

The following example displays the area ID configuration:

Configuring Global IS-IS Parameters

Commands and parameters configured on the global level are inherited to the interface levels. Parameters specified in the interface and interface-level configurations take precedence over global configurations.

The following example displays global-level IS-IS configuration command usage:

The following example displays the modified global-level configuration.

```
A:ALA-A>config>router>isis# info

level-capability level-2
area-id 49.0180.0001
area-id 49.0180.0002
area-id 49.0180.0003
authentication-key "H5KBAWrAAQU" hash
authentication-type password
overload timeout 90
traffic-engineering

A:ALA-A>config>router>isis#
```

Migration to IS-IS Multi-Topology

To migrate to IS-IS multi-topology for IPv6, perform the following tasks:

Enable the sending/receiving of IPv6 unicast reachability information in IS-IS MT TLVs on all the routers that support MT.

```
CLI Syntax: config>router# isis

multi-topology
ipv6-unicast

A:ALA-49>config>router>isis# info detail

...

ipv4-routing
ipv6-routing native
multi-topology
ipv6-unicast
exit
...

A:ALA-49>config>router>isis#
```

Ensure that all MT routers have the IPv6 reachability information required by MT TLVs:

```

Configuring Interface Parameters

There are no interfaces associated with IS-IS by default. An interface belongs to all areas configured on a router. Interfaces cannot belong to separate areas. There are no default interfaces applied to the router's IS-IS instance. You must configure at least one IS-IS interface in order for IS-IS to work.

To enable IS-IS on an interface, first configure an IP interface in the config>router> interface context. Then, apply the interface in the config>router>isis>interface context.

You can configure both the Level 1 parameters and the Level 2 parameters on an interface. The level-capability value determines which level values are used.

NOTE: For point-to-point interfaces, only the values configured under Level 1 are used regardless of the operational level of the interface.

The following example displays the modified interface parameters:

```
Example: config>router# isis
         config>router>isis# level 1
         config>router>isis>level# wide-metrics-only
         config>router>isis>level# exit
         config>router>isis# level 2
         config>router>isis>level# wide-metrics-only
         config>router>isis>level# exit
         config>router>isis# interface ALA-1-2
         config>router>isis>if# level-capability level-2
         config>router>isis>if# mesh-group 85
         config>router>isis>if# exit
         config>router>isis# interface ALA-1-3

A:ALA-C>config>router>isis>if# exit

A:ALA-C>config>router>isis# interface "C-A"

Example: Modifying a Router's Level Capability

In the previous example, ALA-A, ALA-B, and ALA-C are configured as Level 1 systems. Level 1 systems communicate with other Level 1 systems in the same area. In this example, ALA-A is modified to set the level capability to Level 1/2. Now, the Level 1 systems in the area with NET 47.0001 forward PDUs to ALA-A for destinations that are not in the local area.

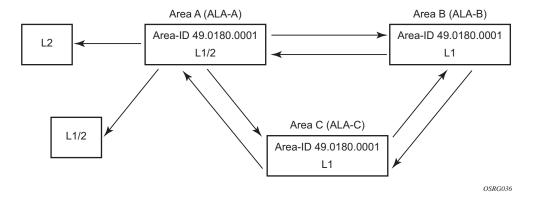

Figure 16: Configuring a Level 1/2 Area

The following example displays the command usage to configure a Level 1/2 system.

A:ALA-A>config>router# isis A:ALA-A>config>router>isis# level-capability level-1/2

IS-IS Configuration Management Tasks

This section discusses the following IS-IS configuration management tasks:

- Disabling IS-IS on page 449
- Removing IS-IS on page 449
- Modifying Global IS-IS Parameters on page 450
- Modifying IS-IS Interface Parameters on page 451
 - → Example: Configuring a Level 1 Area on page 446
 - → Example: Modifying a Router's Level Capability on page 448
- Configuring Leaking on page 453
- Redistributing External IS-IS Routers on page 456
- Specifying MAC Addresses for All IS-IS Routers on page 457

Disabling IS-IS

The shutdown command disables the IS-IS protocol instance on the router. The configuration settings are not changed, reset, or removed.

To disable IS-IS on a router, enter the following commands:

Removing IS-IS

The no isis command deletes the IS-IS protocol instance. The IS-IS configuration reverts to the default settings.

To remove the IS-IS configuration enter the following commands:

Modifying Global IS-IS Parameters

You can modify, disable, or remove global IS-IS parameters without shutting down entities. Changes take effect immediately. Modifying the level capability on the global level causes the IS-IS protocol to restart.

The following example displays command usage to modify various parameters:

The following example displays the global modifications

```
A:ALA-A>config>router>isis# info
       area-id 49.0180.0001
       area-id 49.0180.0002
       area-id 49.0180.0003
       authentication-key "//oZrvtvFPn06S421RIJsE" hash
       authentication-type password
       no authentication-check
       overload timeout 500 on-boot
        level 1
           wide-metrics-only
        exit
        level 2
           wide-metrics-only
        interface "system"
        exit
        interface "ALA-1-2"
           level-capability level-2
           mesh-group 85
        exit
        interface "ALA-1-3"
           level-capability level-1
           interface-type point-to-point
           mesh-group 101
        exit
        interface "ALA-1-5"
           level-capability level-1
           interface-type point-to-point
           mesh-group 85
        interface "to-103"
           mesh-group 101
        exit
        interface "A-B"
        exit
       interface "A-C"
       exit
A:ALA-A>config>router>isis#
```

Modifying IS-IS Interface Parameters

You can modify, disable, or remove interface-level IS-IS parameters without shutting down entities. Changes take effect immediately. Modifying the level capability on the interface causes the IS-IS protocol on the interface to restart.

To remove an interface, issue the no interface *ip-int-name* command. To disable an interface, issue the shutdown command in the interface context.

The following example displays interface IS-IS modification command usage:

```
Example:config>router# isis
    config>router>isis# interface ALA-1-3
    config>router>isis>if# mesh-group 85
    config>router>isis>if# passive
    config>router>isis>if# lsp-pacing-interval 5000
    config>router>isis>if# exit
    config>router>isis# interface to-103
    config>router>isis>if# hello-authentication-type message-digest config>router>isis>if# hello-authentication-key 49ersrule config>router>isis>if# exit
```

The following example displays the modified interface parameters.

```
A:ALA-A>config>router>isis# info
       area-id 49.0180.0001
        area-id 49.0180.0002
        area-id 49.0180.0003
        authentication-key "//oZrvtvFPn06S42lRIJsE" hash
        authentication-type password
       no authentication-check

A:ALA-A>config>router>isis#

Configuring Leaking

IS-IS allows a two-level hierarchy to route PDUs. Level 1 areas can be interconnected by a contiguous Level 2 backbone.

The Level 1 link-state database contains information only about that area. The Level 2 link-state database contains information about the Level 2 system and each of the Level 1 systems in the area. A Level 1/2 router contains information about both Level 1 and Level 2 databases. A Level 1/2 router advertises information about its Level 1 area toward the other Level 1/2 or Level 2 (only) routers.

Packets with destinations outside the Level 1 area are forwarded toward the closest Level 1/2 router which, in turn, forwards the packets to the destination area.

Sometimes, the shortest path to an outside destination is not through the closest Level 1/2 router, or, the only Level 1/2 system to forward packets out of an area is not operational. Route leaking provides a mechanism to leak Level 2 information to Level 1 systems to provide routing information regarding inter-area routes. Then, a Level 1 router has more options to forward packets.

Configure a route policy to leak routers from Level 2 into Level 1 areas in the config>router>policy-options>policy-statement context.

The following example shows the command usage to configure prefix list and policy statement parameters in the config>router context.

```
config>router>policy-options# prefix-list loops
..>policy-options>prefix-list# prefix 10.1.1.0/24 longer
..>policy-options>prefix-list# exit
..>policy-options# policy-statement leak
..>policy-options>policy-statement# entry 10
..>policy-options>policy-statement>entry# from
..>policy-options>policy-statement>entry>from# prefix-list loops
..>policy-options>policy-statement>entry>from# level 2
... >policy-options >policy-statement > entry > from # exit
..>policy-options>policy-statement>entry# to
..>policy-options>policy-statement>entry>to# level 1
..>policy-options>policy-statement>entry>to# exit
..>policy-options>policy-statement>entry# action accept
..>policy-options>policy-statement>entry>action# exit
..>policy-options>policy-statement>entry# exit
..>policy-options>policy-statement#exit
..>policy-options# commit
..>policy-options#
```

```
A:ALA-A>config>router>policy-options# info
          prefix-list "loops"
                  prefix 10.1.1.0/24 longer
           exit
           policy-statement "leak"
               entry 10
                       prefix-list "loop"
                       level 2
                   exit
                       level 1
                   exit
                   action accept
                   exit
               exit
           exit
A:ALA-A>config>router>policy-options#
```

Next, apply the policy to leak routes from Level 2 info Level 1 systems on ALA-A.

```
config>router#isis
config>router>isis# export leak

A:ALA-A>config>router>isis# info

area-id 49.0180.0001
area-id 49.0180.0002
area-id 49.0180.0003
authentication-key "//oZrvtvFPn06S421RIJsE" hash
authentication-type password
no authentication-check
export "leak"
...

A:ALA-A>config>router>isis#
```

After the policy is applied, create a policy to redistribute external IS-IS routes from Level 1 systems into the Level 2 backbone (see Redistributing External IS-IS Routers on page 456). In the config>router context, configure the following policy statement parameters:

```
config>router>policy-options# begin
  ..>policy-options# policy-statement "isis-ext"
  ..>policy-options>policy-statement# entry 10
  ..>policy-options>policy-statement>entry$ from
  ...>policy-options>policy-statement>entry>from$ external
  ..>policy-options>policy-statement>entry>from# exit
  ..>policy-options>policy-statement>entry# to
  ..>policy-options>policy-statement>entry>to$ level 2
  ..>policy-options>policy-statement>entry>to# exit
  ..>policy-options>policy-statement>entry# action accept
  ..>policy-options>policy-statement>entry>action# exit
  ..>policy-options>policy-statement>entry# exit
  ..>policy-options>policy-statement# exit
  ..>policy-options# commit
A:ALA-A>config>router>policy-options# info
         prefix-list "loops"
                prefix 10.1.1.0/24 longer
          exit
          policy-statement "leak"
             entry 10
                from
                    prefix-list "loop"
                    level 2
                 exit
                 to
                    level 1
                 exit
                 action accept
                 exit
             exit
          policy-statement "isis-ext"
             entry 10
                    external
                    level 2
                 exit
                 action accept
                 exit
             exit
          exit
A:ALA-A>config>router>policy-options#
```

Redistributing External IS-IS Routers

IS-IS does not redistribute Level 1 external routes into Level 2 by default. You must explicitly apply the policy to redistribute external IS-IS routes. Policies are created in the config>router>policy-options context. Refer to the *Route Policy* section of this manual for more information.

The following example displays the policy statement configuration.

```
config>router>policy-options# info
          prefix-list "loops"
                 prefix 10.1.1.0/24 longer
           exit
           policy-statement "leak"
               entry 10
                   from
                      prefix-list "loop"
                      level 2
                       level 1
                   exit
                   action accept
                   exit
               exit
           exit
           policy-statement "isis-ext"
               entry 10
                      external
                   exit
                       level 2
                   exit
                   action accept
                   exit
               exit
config>router>policy-options#
```

Specifying MAC Addresses for All IS-IS Routers

Specify the MAC address to use for all L1 or L2 IS-IS routers. The following example shows how to specify all L1 routers:

Example: all-l1isis 01-80-C2-00-00-14

You can also specify the MAC address for all L2 IS-IS routers by using the all-l2isis command.

```

IS-IS Configuration Commands

Generic Commands

isis

Syntax isis [instance-id]

no isis [instance-id]

Context config>router

Description This command creates the context to configure the Intermediate-System-to-Intermediate-System (IS-IS)

protocol instance.

The IS-IS protocol instance is enabled with the **no shutdown** command in the **config>router>isis** context. Alternatively, the IS-IS protocol instance is disabled with the **shutdown** command in the **config>router>isis**

context

The **no** form of the command deletes the IS-IS protocol instance. Deleting the protocol instance removes all

configuration parameters for this IS-IS instance.

Parameters *instance-id* — Specifies the instance ID for an IS-IS instance.

Values 1–31

Default 0

shutdown

Syntax [no] shutdown

Context config>router>isis

config>router>isis>interface *ip-int-name* config>router>isis>if>level *level-number*

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or

remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within.

Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Special Cases IS-IS Global — In the config>router>isis context, the shutdown command disables the IS-IS protocol

instance. By default, the protocol is enabled, no shutdown.

IS-IS Interface — In the **config>router>isis>interface** context, the command disables the IS-IS interface.

By default, the IS-IS interface is enabled, **no shutdown**.

IS-IS Configuration Commands

IS-IS Interface and Level — In the config>router>isis>interface *ip-int-name*>level context, the command disables the IS-IS interface for the level. By default, the IS-IS interface at the level is enabled, **no shut-down**.

Default no shutdown — IS-IS entity is administratively enabled.

tag

Syntax tag tag

no tag

Context config>router>isis>interface

Description This command configures a route tag to the specified IP address of an interface.

Parameters tag = [1..4294967295]

all-l1isis

Syntax all-l1isis ieee-address

no all-l1isis

Context config>router>isis

Description This command enables you to specify the MAC address to use for all L1 IS-IS routers. The MAC address

should be a multicast address. You should shut/no shut the IS-IS instance to make the change operational.

Default all-11isis 01-80-C2-00-01-00

Parameters ieee-address — Specifies the destination MAC address for all L1 I-IS neighbors on the link for this ISIS

instance.

all-l2isis

Syntax all-l2isis ieee-address

no all-l2isis

Context config>router>isis

Description This command enables you to specify the MAC address to use for all L2 IS-IS routers. The MAC address

should be a multicast address. You should shut/no shut the IS-IS instance to make the change operational.

Default all-l2isis 01-80-C2-00-02-11

Parameters ieee-address — Specifies the destination MAC address for all L2 ISIS neighbors on the link for this ISIS

instance.

authentication-check

Syntax [no] authentication-check

Context config>router>isis

Description This command sets an authentication check to reject PDUs that do not match the type or key requirements.

The default behavior when authentication is configured is to reject all IS-IS protocol PDUs that have a mis-

match in either the authentication type or authentication key.

When **no authentication-check** is configured, authentication PDUs are generated and IS-IS PDUs are authenticated on receipt. However, mismatches cause an event to be generated and will not be rejected.

The **no** form of this command allows authentication mismatches to be accepted and generate a log event.

Default authentication-check — Rejects authentication mismatches.

authentication-key

Syntax authentication-key [authentication-key | hash-key] [hash | hash2]

no authentication-key

Context config>router>isis

config>router>isis>level level-number

Description This command sets the authentication key used to verify PDUs sent by neighboring routers on the interface.

Neighboring routers use passwords to authenticate PDUs sent from an interface. For authentication to work, both the authentication *key* and the authentication *type* on a segment must match. The **authentication-type**

statement must also be included.

To configure authentication on the global level, configure this command in the **config>router>isis** context. When this parameter is configured on the global level, all PDUs are authenticated including the hello PDU.

To override the global setting for a specific level, configure the **authentication-key** command in the **config>router>isis>level** context. When configured within the specific level, hello PDUs are not authenticated.

The **no** form of the command removes the authentication key.

Default no authentication-key — No authentication key is configured.

Parameters authentication-key — The authentication key. The key can be any combination of ASCII characters up to 255 characters in length (un-encrypted). If spaces are used in the string, enclose the entire string in quo-

tation marks ("").

hash-key — The hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

authentication-type

Syntax authentication-type {password | message-digest}

no authentication

Context config>router>isis

config>router>isis>level level-number

Description This command enables either simple password or message digest authentication or must go in either the

global IS-IS or IS-IS level context.

Both the authentication key and the authentication type on a segment must match. The authentication-key

statement must also be included.

Configure the authentication type on the global level in the **config>router>isis** context.

Configure or override the global setting by configuring the authentication type in the con-

fig>router>isis>level context.

The **no** form of the command disables authentication.

Default no authentication-type — No authentication type is configured and authentication is disabled.

Parameters password — Specifies that simple password (plain text) authentication is required.

message-digest — Specifies that MD5 authentication in accordance with RFC2104 is required.

bfd-enable

Syntax [no] bfd-enable ipv4

Context config>router>isis>interface

Description This command enables the use of bi-directional forwarding (BFD) to control IPv4 adjacencies. By enabling

BFD on an IPv4 protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD are set via the BFD command

under the IP interface.

The no form of this command removes BFD from the associated IPv4 adjacency.

Default no bfd-enable ipv4

default-route-tag

Syntax default-route-tag tag

no default-route-tag

Context config>router>isis

Description This command configures the route tag for default route.

Parameters tag - tag - Assigns a default tag

Values Accepts decimal or hex formats:

ISIS: [0x0..0xFFFFFFF]H

Values 1 — 4294967295

csnp-authentication

Syntax [no] csnp-authentication

Context config>router>isis

config>router>isis>level level-number

Description This command enables authentication of individual ISIS packets of complete sequence number PDUs

(CSNP) type.

The **no** form of the command suppresses authentication of CSNP packets.

csnp-interval

Syntax csnp-interval seconds

no csnp-interval

Context config>router>isis>interface ip-int-name

Description This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs

from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of the command reverts to the default value.

Default csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

Parameters seconds — The time interval, in seconds between successive CSN PDUs sent from this interface expressed

as a decimal integer.

Values 1 — 65535

IS-IS Configuration Commands

default-metric

Syntax default-metric ipv4 metric

no default-metric

Context config>router>isis>level

Description This command specifies the configurable default metric used for all IS-IS interfaces on this level. This value

is not used if a metric is configured for an interface.

Default 10

ipv4 metric — Specifies the default metric for IPv4 unicast.

Values 1 — 16777215

disable-ldp-sync

Syntax [no] disable-ldp-sync

Context config>router>isis

Description This command disables the IGP-LDP synchronization feature on all interfaces participating in the

OSPF or IS-IS routing protocol. When this command is executed, IGP immediately advertises the actual value of the link cost for all interfaces which have the IGP-LDP synchronization enabled if the currently advertized cost is different. It will then disable IGP-LDP synchronization for all interfaces. This command does not delete the interface configuration. The **no** form of this command has to be entered to re-enable IGP-LDP synchronization for this routing protocol.

The **no** form of this command restores the default settings and re-enables IGP-LDP synchronization on all interfaces participating in the OSPF or IS-IS routing protocol and for which

the ldp-sync-timer is configured.

Default no disable-ldp-sync

export

Syntax [no] export policy-name [policy-name...up to 5 max]

Context config>router>isis

Description This command configures export routing policies that determine the routes exported from the routing table to

IS-IS.

If no export policy is defined, non IS-IS routes are not exported from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered overrides the previous command. A maximum of five policy names can be specified.

If an **aggregate** command is also configured in the **config>router** context, then the aggregation is applied before the export policy is applied.

Routing policies are created in the **config>router>policy-options** context.

The **no** form of the command removes the specified *policy-name* or all policies from the configuration if no *policy-name* is specified.

Default no export — No export policy name is specified.

Parameters policy-name — The export policy name. Up to five policy-name arguments can be specified.

export-limit

Syntax export-limit number [log percentage]

no export-limit

Context config>router>isis

Description This command configures the maximum number of routes (prefixes) that can be exported into IS-IS from the

route table.

The **no** form of the command removes the parameters from the configuration.

Default no export-limit, the export limit for routes or prefixes is disabled..

Parameters *number* — Specifies the maximum number of routes (prefixes) that can be exported into RIP from the route

table.

Values 1 — 4294967295

log percentage — Specifies the percentage of the export-limit, at which a warning log message and SNMP

notification would be sent.

Values 1 — 100

external-preference

Syntax external-preference preference

no external-preference

Context config>router>isis>level *level-number*

Description This command configures the external route preference for the IS-IS level.

The **external-preference** command configures the preference level of either IS-IS level 1 or IS-IS level 2

external routes. By default, the preferences are as listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable.

When this occurs, the preference decides the route to use.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is dependent on the default preference table. If multiple routes are learned with an identical preference using the

same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of the route to use is determined by the configuration of the **ecmp** in the **config>router** context.

Default

Default preferences are listed in the following table:

Route Type	Preference	Configurable
Direct attached	0	No
Static-route	5	Yes
OSPF internal routes	10	No
IS-IS Level 1 internal	15	Yes*
IS-IS Level 2 internal	18	Yes*
OSPF external	150	Yes
IS-IS Level 1 external	160	Yes
IS-IS Level 2 external	165	Yes
BGP	170	Yes

^{*.} Internal preferences are changed using the **preference** command in the config>router>isis>level *level-number* context

Parameters

preference — The preference for external routes at this level as expressed.

Values 1 — 255

graceful-restart

Syntax [no] graceful-restart

Context config>router>isis

Description This command ena

This command enables graceful-restart helper support for ISIS. The 7750 SR OS will act as a helper to neighbors who are graceful-restart-capable and are restarting.

When the control plane of a graceful-restart-capable router fails, the neighboring routers (graceful-restart helpers) temporarily preserve adjacency information so packets continue to be forwarded through the failed graceful-restart router using the last known routes. If the control plane of the graceful-restart router comes back up within the timer limits, then the routing protocols re-converge to minimize service interruption.

The **no** form of the command disables graceful restart and removes all graceful restart configurations in the ISIS instance.

Default disabled

helper-disable

Syntax [no] helper-disable

Context config>router>isis>graceful-restart

Description This command disables the helper support for graceful restart.

When **graceful-restart** is enabled, the router can be a helper (meaning that the router is helping a neighbor to restart) or be a restarting router or both. The 7750 SR OS supports only helper mode. This facilitates the graceful restart of neighbors but will not act as a restarting router (meaning that the 7750 SR OS will not help the neighbors to restart).

The no helper-disable command enables helper support and is the default when graceful-restart is enabled.

Default disabled

hello-authentication

Syntax [no] hello-authentication

Context config>router>isis

config>router>isis>level level-number

Description This command enables authentication of individual ISIS packets of HELLO type.

The **no** form of the command suppresses authentication of HELLO packets.

hello-authentication-key

Syntax hello-authentication-key [authentication-key | hash-key] [hash | hash2]

no hello-authentication-key

Context config>router>isis>interface *ip-int-name*

config>router>isis>if>level level-number

Description This command configures the authentication key (password) for hello PDUs. Neighboring routers use the

password to verify the authenticity of hello PDUs sent from this interface. Both the hello authentication key and the hello authentication type on a segment must match. The **hello-authentication-type** must be speci-

fied.

To configure the hello authentication key in the interface context use the **hello-authentication-key** in the **config>router>isis>interface** context.

To configure or override the hello authentication key for a specific level, configure the **hello-authentication-key** in the **config>router>isis>interface>level** context.

If both IS-IS and hello-authentication are configured, hello messages are validated using hello authentication. If only IS-IS authentication is configured, it will be used to authenticate all IS-IS (including hello) protocol PDUs.

When the hello authentication key is configured in the **config>router>isis>interface** context, it applies to all levels configured for the interface.

The **no** form of the command removes the authentication-key from the configuration.

Default no hello-authentication-key — No hello authentication key is configured.

Parameters

authentication-key — The hello authentication key (password). The key can be any combination of ASCII characters up to 254 characters in length (un-encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

hash-key — The hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

hello-authentication-type

Syntax hello-authentication-type {password | message-digest}

no hello-authentication-type

Context config>router>isis>interface *ip-int-name*

config>router>isis>if>level level-number

Description This command enables hello authentication at either the interface or level context. Both the hello authentica-

tion key and the hello authentication type on a segment must match. The hello authentication-key statement

must also be included.

To configure the hello authentication type at the interface context, use **hello-authentication-type** in the **con-**

fig>router>isis>interface context.

To configure or override the hello authentication setting for a given level, configure the hello-authentica-

tion-type in the config>router>isis>interface>level context.

The no form of the command disables hello authentication.

Default no hello-authentication-type — Hello authentication is disabled.

Parameters password — Specifies simple password (plain text) authentication is required.

message-digest — Specifies MD5 authentication in accordance with RFC2104 (HMAC: Keyed-Hashing for Message Authentication) is required.

hello-interval

Syntax hello-interval seconds

no hello-interval

Context config>router>isis>if>level level-number

Description This command configures the interval in seconds between hello messages issued on this interface at this

level.

The **no** form of the command to reverts to the default value.

Default 3 — Hello interval default for the designated intersystem.

9 — Hello interval default for non-designated intersystems.

Parameters seconds — The hello interval in seconds expressed as a decimal integer.

Values 1 — 20000

hello-multiplier

Syntax hello-multiplier multiplier

no hello-multiplier

Context config>router>isis>if>level level-number

Description This command configures the number of missing hello PDUs from a neighbor after the router declares the

adjacency down.

The **no** form of the command reverts to the default value.

Default 3 — The router can miss up to 3 hello messages before declaring the adjacency down.

Parameters multiplier — The multiplier for the hello interval expressed as a decimal integer.

Values 2 — 100

ipv6-unicast-metric

Syntax ipv6-unicast-metric metric

no ipv6-unicast-metric

Context config>router>isis>if>level

Description This command configures IS-IS interface metric for IPv6 unicast.

The **no** form of this command removes the metric from the configuration.

IS-IS Configuration Commands

Parameters *metric* — Specifies the IS-IS interface metric for IPv6 unicast.

Values 1 — 16777215

interface

Syntax [no] interface ip-int-name

Context config>router>isis

Description This command creates the context to configure an IS-IS interface.

When an area is defined, the interfaces belong to that area. Interfaces cannot belong to separate areas.

When the interface is a POS channel, the OSINCP is enabled when the interface is created and removed

when the interface is deleted.

The **no** form of the command removes IS-IS from the interface.

The shutdown command in the config>router>isis>interface context administratively disables IS-IS on the

interface without affecting the IS-IS configuration.

Default no interface — No IS-IS interfaces are defined.

Parameters ip-int-name — Identify the IP interface name created in the **config>router>interface** context. The IP inter-

face name must already exist.

interface-type

Syntax interface-type {broadcast | point-to-point}

no interface-type

Context config>router>isis>interface *ip-int-name*

Description This command configures the IS-IS interface type as either broadcast or point-to-point.

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the

designated IS-IS overhead if the link is used as a point-to-point.

If the interface type is not known at the time the interface is added to IS-IS and subsequently the IP interface

is bound (or moved) to a different interface type, then this command must be entered manually.

The **no** form of the command reverts to the default value.

Special Cases SONET — Interfaces on SONET channels default to the point-to-point type.

Ethernet or Unknown — Physical interfaces that are Ethernet or unknown default to the broadcast type.

Default point-to-point — For IP interfaces on SONET channels.

broadcast — For IP interfaces on Ethernet or unknown type physical interfaces.

Parameters broadcast — Configures the interface to maintain this link as a broadcast network.

point-to-point — Configures the interface to maintain this link as a point-to-point link.

ipv4-routing

Syntax [no] ipv4-routing

Context config>router>isis

Description This command specifies whether this IS-IS instance supports IPv4.

The **no** form of the command disables IPv4 on the IS-IS instance.

Default ipv4-routing

ipv6-routing

Syntax [no] ipv6-routing {native | mt}

Context config>router>isis

Description This command enables IPv6 routing.

The no form of the command disables support for IS-IS IPv6 TLVs for IPv6 routing.

Default disabled

Parameters native — Enables IS-IS IPv6 TLVs for IPv6 routing and enables support for native IPv6 TLVs.

mt — Enables IS-IS multi-topology TLVs for IPv6 routing. When this parameter is specified, the support

for native IPv6 TLVs is disabled.

Idp-over-rsvp

Syntax [no] Idp-over-rsvp

Context config>router>isis

Description This command allows LDP over RSVP processing in IS-IS.

The no form of the command disables LDP over RSVP processing.

Default no ldp-over-rsvp

iid-tlv-enable

Syntax [no] iid-tlv-enable

Context config>router>isis

Description This command specifies whether Instance Identifier (IID) TLV has been enabled or disabled for this ISIS

instance.

IS-IS Configuration Commands

When enabled, each I-IS instance marks its packets with the IID TLV containing its unique 16-bit IID for the routing domain. You should shut/no shut the isis instance to make the change operational.

Default no iid-tly-enable

level

Syntax level level-number

Context config>router>isis

config>router>isis>interface ip-int-name

Description This command creates the context to configure IS-IS Level 1 or Level 2 area attributes.

A router can be configured as a Level 1, Level 2, or Level 1-2 system. A Level 1 adjacency can be established if there is at least one area address shared by this router and a neighbor. A Level 2 adjacency cannot be established over this interface.

Level 1/2 adjacency is created if the neighbor is also configured as Level 1/2 router and has at least one area address in common. A Level 2 adjacency is established if there are no common area IDs.

A Level 2 adjacency is established if another router is configured as Level 2 or a Level 1/2 router with interfaces configured as Level 1/2 or Level 2. Level 1 adjacencies will not established over this interface.

To reset global and/or interface level parameters to the default, the following commands must be entered independently:

level> no hello-authentication-key

level> no hello-authentication-type

level> no hello-interval

level> no hello-multiplier

level> no metric

level> no passive

level> no priority

Special Cases Global IS-IS Level — The config>router>isis context configures default global parameters for both

Level 1 and Level 2 interfaces.

IS-IS Interface Level — The **config>router>isis>interface** context configures IS-IS operational characteristics of the interface at Level 1 and/or Level 2. A logical interface can be configured on one Level 1 and one Level 2. In this case, each level can be configured independently and parameters must be removed independently.

By default an interface operates in both Level 1 and Level 2 modes.

Default level 1 or level 2

Parameters *level-number* — The IS-IS level number.

Values 1, 2

level-capability

Syntax level-capability {level-1 | level-2 | level-1/2}

no level-capability

Context config>router>isis

config>router>isis>interface ip-int-name

Description This command configures the routing level for an instance of the IS-IS routing process.

An IS-IS router and an IS-IS interface can operate at Level 1, Level 2 or both Level 1 and 2.

Table 13 displays configuration combinations and the potential adjacencies that can be formed.

Table 13: Potential Adjacency Capabilities

Global Level	Interface Level	Potential Adjacency
L 1/2	L 1/2	Level 1 and/or Level 2
L 1/2	L 1	Level 1 only
L 1/2	L 2	Level 2 only
L 2	L 1/2	Level 2 only
L 2	L 2	Level 2 only
L 2	L 1	none
L 1	L 1/2	Level 1 only
L 1	L 2	none
L 1	L 1	Level 1 only

The **no** form of the command removes the level capability from the configuration.

Special Cases

IS-IS Router — In the **config>router>isis** context, changing the **level-capability** performs a restart on the IS-IS protocol instance.

IS-IS Interface — In the **config>router>isis>interface** context, changing the **level-capability** performs a restart of IS-IS on the interface.

Default level-1/2

Parameters level-1 — Specifies the router/interface can operate at Level 1 only.

level-2 — Specifies the router/interface can operate at Level 2 only.

level-1/2 — Specifies the router/interface can operate at both Level 1 and Level 2.

Isp-pacing-interval

Syntax Isp-pacing-interval milliseconds

no Isp-pacing-interval

Context config>router>isis>interface ip-int-name

Description This command configures the interval between LSP PDUs sent from this interface.

To avoid bombarding adjacent neighbors with excessive data, pace the Link State Protocol Data Units

(LSP's). If a value of zero is configured, no LSP's are sent from the interface.

The **no** form of the command reverts to the default value.

Default 100 — LSPs are sent in 100 millisecond intervals.

Parameters milliseconds — The interval in milliseconds that IS-IS LSP's can be sent from the interface expressed as a

decimal integer.

Values 0 — 65535

Isp-lifetime

Syntax Isp-lifetime seconds

no Isp-lifetime

Context config>router>isis

Description This command sets the time, in seconds, the router wants the LSPs it originates to be considered valid by

other routers in the domain.

Each LSP received is maintained in an LSP database until the **lsp-lifetime** expires unless the originating router refreshes the LSP. By default, each router refreshes its LSP's every 20 minutes (1200 seconds) so

other routers will not age out the LSP.

The LSP refresh timer is derived from this formula: lsp-lifetime/2

The no form of the command reverts to the default value.

Default 1200 — LSPs originated by the router should be valid for 1200 seconds (20 minutes).

Parameters seconds — The time, in seconds, that the router wants the LSPs it originates to be considered valid by other

routers in the domain.

Values 350 — 65535

Isp-mtu-size

Syntax Isp-mtu-size size

no Isp-mtu-size

Context config>router>isis

Description This command configures the LSP MTU size. If the *size* value is changed from the default using CLI or

SNMP, then ISIS must be restarted in order for the change to take effect. This can be done by performing a **shutdown** command and then a **no shutdown** command in the **config>router>isis** context. Note: Using the **exec** command to execute a configuration file to change the LSP MTU-size from its default value will auto-

matically bounce IS-IS for the change to take effect.

The **no** form of the command reverts to the default value.

Default 1492

Parameters *size* — Specifies the LSP MTU size.

Values 490 — 9190

Isp-wait

Syntax | Isp-wait | Isp-initial-wait | Isp-second-wait |

Context config>router>isis

Description This command is used to customize the throttling of IS-IS LSP-generation. Timers that determine when to

generate the first, second and subsequent LSPs can be controlled with this command. Subsequent LSPs are

generated at increasing intervals of the second lsp-wait timer until a maximum value is reached.

Parameters *lsp-max-wait* — Specifies the maximum interval in seconds between two consecutive ocurrences of an LSP

being generated.

Values 1 — 120

Default 5

lsp-initial-wait — Specifies the initial LSP generation delay in seconds.

Values 0 — 100

Default 0

lsp-second-wait — Specifies the hold time in seconds between the first and second LSP generation.

Values 1 — 100

Default 1

IS-IS Configuration Commands

mcast-import-ipv6

Syntax [no] mcast-import-ipv6

Context configure>router>isis

Description This command administratively enables/disables submission of routes into the IPv6 multicast RTM by IS-IS.

multi-topology

Syntax [no] multi-topology

Context config>router>isis

Description This command enables IS-IS multi-topology support.

Default disabled

ipv6-unicast

Syntax [no] ipv6-unicast

Context config>router>isis>multi-topology

Description This command enables multi-topology TLVs.

The no form of the command disables multi-topology TLVs.

multicast-import

Syntax [no] multicast-import

Context config>router>isis

Description This command enables the submission of routes into the multicast Route Table Manager (RTM) by IS-IS.

The **no** form of the command disables the submission of routes into the multicast RTM.

Default no multicast-import

mesh-group

Syntax mesh-group {value / blocked}

no mesh-group

Context config>router>isis>interface ip-int-name

Description This command assigns an interface to a mesh group. Mesh groups limit the amount of flooding that occurs

when a new or changed LSP is advertised throughout an area.

All routers in a mesh group should be fully meshed. When LSPs need to be flooded, only a single copy is

received rather than a copy per neighbor.

To create a mesh group, configure the same mesh group value for each interface that is part of the mesh group. All routers must have the same mesh group value configured for all interfaces that are part of the

mesh group.

To prevent an interface from flooding LSPs, the optional **blocked** parameter can be specified. Configure mesh groups carefully. It is easy to created isolated islands that do not receive updates as (other) links fail.

The **no** form of the command removes the interface from the mesh group.

Default no mesh-group — The interface does not belong to a mesh group.

Parameters value — The unique decimal integer value distinguishes this mesh group from other mesh groups on this or

any other router that is part of this mesh group.

Values 1 — 2000000000

blocked — Prevents an interface from flooding LSPs.

ipv6-unicast-disable

Syntax [no] ipv6-unicast-disable

Context config>router>isis>if

Description This command disables IS-IS IPv6 unicast routing for the interface.

By default IPv6 unicast on all interfaces is enabled. However, IPv6 unicast routing on IS-IS is in effect when

the **config>router>isis>ipv6-routing mt** command is configured.

The **no** form of the command enables IS-IS IPv6 unicast routing for the interface.

metric

Syntax metric metric

no metric

Context config>router>isis>if>level level-number

Description This command configures the metric used for the level on the interface.

IS-IS Configuration Commands

In order to calculate the lowest cost to reach a given destination, each configured level on each interface must have a cost. The costs for each level on an interface may be different.

If the metric is not configured, the default of 10 is used unless reference bandwidth is configured.

The **no** form of the command reverts to the default value.

Default 10 — A metric of 10 for the level on the interface is used.

Parameters *metric* — The metric assigned for this level on this interface.

Values 1 — 16777215

advertise-passive-only

Syntax [no] advertise-passive-only

Context config>router>isis

Description This command enables and disables IS-IS to advertise only prefixes that belong to passive interfaces.

area-id

Syntax [no] area-id area-address

Context config>router>isis

Description

This command was previously named the **net** *network-entity-title* command. The **area-id** command allows you to configure the area ID portion of NSAP addresses which identifies a point of connection to the network, such as a router interface, and is called a Network Service Access Point (NSAP). Addresses in the IS-IS protocol are based on the ISO NSAP addresses and Network Entity Titles (NETs), not IP addresses.

A maximum of 3 area addresses can be configured.

NSAP addresses are divided into three parts. Only the area ID portion is configurable.

- Area ID A variable length field between 1 and 13 bytes long. This includes the Authority and Format Identifier (AFI) as the most significant byte and the area ID.
- System ID A six-byte system identification. This value is not configurable. The system ID is derived from the system or router ID.
- Selector ID A one-byte selector identification that must contain zeros when configuring a NET. This value is not configurable. The selector ID is always 00.

The NET is constructed like an NSAP but the selector byte contains a 00 value. NET addresses are exchanged in hello and LSP PDUs. All net addresses configured on the node are advertised to its neighbors.

For Level 1 interfaces, neighbors can have different area IDs, but, they must have at least one area ID (AFI + area) in common. Sharing a common area ID, they become neighbors and area merging between the potentially different areas can occur.

For Level 2 (only) interfaces, neighbors can have different area IDs. However, if they have no area IDs in common, they become only Level 2 neighbors and Level 2 LSPs are exchanged.

For Level 1 and Level 2 interfaces, neighbors can have different area IDs. If they have at least one area ID (AFI + area) in common, they become neighbors. In addition to exchanging Level 2 LSPs, area merging between potentially different areas can occur.

If multiple **area-id** commands are entered, the system ID of all subsequent entries must match the first area address.

The **no** form of the command removes the area address.

Default none — No area address is assigned.

Parameters area-address — The 1 — 13-byte address. Of the total 20 bytes comprising the NET, only the first 13 bytes

can be manually configured. As few as one byte can be entered or, at most, 13 bytes. If less than 13 bytes are

entered, the rest is padded with zeros.

overload

Syntax overload [timeout seconds]

no overload

Context config>router>isis

Description This command administratively sets the IS-IS router to operate in the overload state for a specific time period, in seconds, or indefinitely.

During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is only used if the destination is reachable by the router and will not used for other transit traffic.

If a time period is specified, the overload state persists for the configured length of time. If no time is specified, the overload state operation is maintained indefinitely.

The **overload** command can be useful in circumstances where the router is overloaded or used prior to executing a **shutdown** command to divert traffic around the router.

The **no** form of the command causes the router to exit the overload state.

Default no overload

Parameters seconds — The time, in seconds, that this router must operate in overload state.

Default infinity (overload state maintained indefinitely)

Values 60 — 1800

overload-on-boot

Syntax overload-on-boot [timeoutseconds]

no overload-on-boot

Context config>router>isis

Description

When the router is in an overload state, the router is used only if there is no other router to reach the destination. This command configures the IGP upon bootup in the overload state until one of the following events occur:

- 1. The timeout timer expires.
- A manual override of the current overload state is entered with the config>router>isis>no overload command.

The **no overload** command does not affect the **overload-on-boot** function.

If no timeout is specified, IS-IS will go into overload indefinitely after a reboot. After the reboot, the IS-IS status will display a permanent overload state:

L1 LSDB Overload : Manual on boot (Indefinitely in overload)

L2 LSDB Overload : Manual on boot (Indefinitely in overload)

This state can be cleared with the config>router>isis>no overload command.

When specifying a timeout value, IS-IS will go into overload for the configured timeout after a reboot. After the reboot, the IS-IS status will display the remaining time the system stays in overload:

L1 LSDB Overload: Manual on boot (Overload Time Left: 17)

L2 LSDB Overload: Manual on boot (Overload Time Left: 17)

The overload state can be cleared before the timeout expires with the **config>router>isis>no overload** command

The **no** form of the command removes the overload-on-boot functionality from the configuration.

Default no overload-on-boot

Use **show router ospf status** and/or **show router isis status** commands to display the administrative and operational state as well as all timers.

Parameters timeout seconds — Configure the timeout timer for overload-on-boot in seconds.

Values 60 — 1800

passive

Syntax [no] passive

Context config>router>isis>interface *ip-int-name*

config>router>isis>if>level level-number

Description This command adds the passive attribute which causes the interface to be advertised as an IS-IS interface

without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are

advertised as IS-IS interfaces at the level that they are configured.

When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol

PDUs and will not transmit IS-IS protocol PDUs.

The **no** form of the command removes the passive attribute.

Special Cases Service Interfaces — Service interfaces (defined using the service-prefix command in config>router)

are passive by default.

All other Interfaces — All other interfaces are not passive by default.

Default passive — Service interfaces are passive.

no passive — All other interfaces are not passive.

preference

Syntax preference preference

no preference

Context config>router>isis>level *level-number*

Description This command configures the preference level of either IS-IS Level 1 or IS-IS Level 2 internal routes. By

default, the preferences are listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the table below. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision what route to use is determined by the configuration of the **ecmp** in the config>router context.

Default Default preferences are listed in the following table:

	Route Type	Preference	Configurable	
D	irect attached	0	No	
St	atic-route	5	Yes	

Route Type	Preference	Configurable	(Continued)
OSPF internal routes	10	No	
IS-IS level 1 internal	15	Yes	
IS-IS level 2 internal	18	Yes	
OSPF external	150	Yes	
IS-IS level 1 external	160	Yes*	
IS-IS level 2 external	165	Yes*	
BGP	170	Yes	

^{*.} External preferences are changed using the external-preference command in the config>router>isis>level level-number context.

Parameters

preference — The preference for external routes at this level expressed as a decimal integer.

Values 1 - 255

priority

Syntax priority number

no priority

config>router>isis>if>level level-number Context

Description This command configures the priority of the IS-IS router interface for designated router election on a multi-

access network.

This priority is included in hello PDUs transmitted by the interface on a multi-access network. The router with the highest priority is the preferred designated router. The designated router is responsible for sending LSPs with regard to this network and the routers that are attached to it.

The **no** form of the command reverts to the default value.

Default

Parameters

number — The priority for this interface at this level.

Values 0 - 127

psnp-authentication

Syntax [no] psnp-authentication

Context config>router>isis

config>router>isis>level

Description This command enables authentication of individual ISIS packets of partial sequence number PDU (PSNP)

type.

The **no** form of the command suppresses authentication of PSNP packets.

reference-bandwidth

Syntax reference-bandwidth reference-bandwidth

no reference-bandwidth

Context config>router>isis

Description This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

In order to calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following for-

mula:

cost = reference-bandwidth ÷ bandwidth

If the reference bandwidth is configured as 10 Gigabits (10,000,000,000), a 100 M/bps interface has a default metric of 100. In order for metrics in excess of 63 to be configured, wide metrics must be deployed. (See wide-metrics-only in the **config>router>isis** context.)

If the reference bandwidth is not configured, then all interfaces have a default metric of 10.

The **no** form of the command reverts to the default value.

Default no reference-bandwidth — No reference bandwidth is defined. All interfaces have a metric of 10.

Parameters reference-bandwidth — The reference bandwidth in kilobits per second expressed as a decimal integer.

rsvp-shortcut

Syntax [no] rsvp-shortcut

Context config>router>isis

Description This command enables the use of an RSVP-TE shortcut for resolving IGP routes by IS-IS or OSPF routing

protocols.

This command instructs IS-IS or OSPF to include RSVP LSPs originating on this node and terminating on the router-id of a remote node as direct links with a metric equal to the operational metric provided by MPLS.

When **rsvp-shortcut** is enabled at the IGP instance level, all RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config-**

ure>router>mpls>lsp>to, corresponds to a router-id of a remote node. RSVP LSPs with a destination address corresponding to an interface address of a remote node are automatically not considered by IS-IS or OSPF. The user can however exclude a specific RSVP LSP from being used as a shortcut for resolving IGP routes by entering the command **config>router>mpls>lsp>no igp-shortcut**.

Also, the SPF in OSPF or IS-IS will only use RSVP LSPs as IGP shortcuts or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If the user enabled both options at the IGP instance level, then the shortcut application takes precedence when the LSP level configuration has both options enabled.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet in RTM will result in the resolution of the packet to an RSVP LSP if all the following conditions are satisfied:

- RSVP shortcut is enabled on the IGP routing protocol which has a route for the packet's destination address.
- SPF has pre-determined that the IGP path cost using the RSVP LSP shortcut is the best.

In this case, the packet is sent labeled with the label stack corresponding to the NHLFE of the RSVP LSP.

The failure of an RSVP LSP shortcut or of a local interface triggers a full SPF computation which may result in installing a new route over another RSVP LSP shortcut or a regular IP next-hop.

When ECMP is enabled and multiple equal-cost paths exist for the IGP route, the ingress IOM will spray the packets for this route based on hashing routine currently supported for IPv4 packets. Spraying will be performed across a regular IP next-hop and across an RSVP shortcut next-hop as long as the IP path does not go over the tail-end of the RSVP LSP.

The **no** form of this command disables the resolution of IGP routes using RSVP shortcuts.

Default no rsvp-shortcut

advertise-tunnel-links

Syntax [no] advertise-tunnel-links

Context config>router>isis

Description This command enables the advertisement of RSVP LSP shortcuts into IGP similar to regular links so that

other routers in the network can include them in their SPF computations. An LSP must exist in the reverse direction in order for the advertized link to pass the bi-directional link check and be usable by other routers in the network. However, this is not required for the node which originates the LSP.

The LSP is advertised as an unnumbered point-to-point link and the link LSP/LSA has no Traffic

Engineering opaque sub-TLVs per RFC 3906.

The no form of this command disables the advertisement of RSVP LSP shortcuts into IGP.

Default no advertise-tunnel-links

retransmit-interval

Syntax retransmit-interval seconds

no retransmit-interval

Context config>router>isis>interface ip-int-name

Description This command configures the minimum time between LSP PDU retransmissions on a point-to-point inter-

face

The **no** form of the command reverts to the default value.

Default 100

Parameters seconds — The interval in seconds that IS-IS LSPs can be sent on the interface.

Values 1 — 65535

spf-wait

Syntax [no] spf-wait spf-wait [spf-initial-wait [spf-second-wait]]

Context config>router>isis

Description This command defines the maximum interval between two consecutive SPF calculations in seconds. Timers

that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command. Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the *spf-wait* value. The SPF interval will stay at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to

spf-initial-wait.

Default no spf-wait

Parameters spf-wait — Specifies the maximum interval in seconds between two consecutive spf calculations.

Values 1 — 120

Default 10

spf-initial-wait — Specifies the initial SPF calculation delay in milliseconds after a topology change.

Values 10 — 100000

Default 1000

spf-second-wait — Specifies the hold time in milliseconds between the first and second SPF calculation.

Values 1 — 100000

Default 1000

strict-adjacency-check

Syntax [no] strict-adjacency-check

Context config>router>isis

Description This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When

enabled, adjacencies will not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it will be torn down. This command is

used to prevent black-holing traffic when IPv4 and IPv6 topologies are different.

When disabled (no strict-adjacency-check), both routers only need to have one common address family to

establish the adjacency.

Default no strict-adjacency-check

summary-address

Syntax summary-address {ip-prefix/mask | ip-prefix [netmask]} level [tag tag]

no summary-address {ip-prefix/mask | ip-prefix [netmask]}

Context config>router>isis

Description This command creates summary-addresses.

Default none

Parameters *ip-prefix/mask* — Specifies information for the specified IP prefix and mask length.

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-length: 0 - 32

ipv6-prefix: x:x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D [0 — 128]

ipv6-prefix-length: [0-128] netmask — The subnet mask in dotted decimal notation.

Values 0.0.0.0 — 255.255.255.255 (network bits all 1 and host bits all 0)

level — Specifies IS-IS level area attributes.

Values level-1, level-2, level-1/2

tag tag — Assigns an OSPF, RIP or ISIS tag to routes matching the entry.

Values Accepts decimal or hex formats:

OSPF and ISIS: [0x0..0xFFFFFFF]H RIP: [0x0..0xFFFF]H

suppress-default

Syntax [no] suppress-default

Context config>router>isis

Description This command enables or disables IS-IS to suppress the installation of default routes.

traffic-engineering

Syntax [no] traffic-engineering

Context config>router>isis

Description This command configures traffic-engineering and determines if IGP shortcuts are required by BGP.

Default disabled

unicast-import-disable

Syntax [no] unicast-import-disable

Context config>router>isis

Description This command allows one IGP to import its routes into RPF RTM while another IGP imports routes only

into the unicast RTM. Import policies can redistribute routes from an IGP protocol into the RPF RTM (the multicast routing table). By default, the IGP routes will not be imported into RPF RTM as such an import

policy must be explicitly configured.

Default disabled

wide-metrics-only

Syntax [no] wide-metrics-only

Context config>router>isis>level level-number

Description This command enables the exclusive use of wide metrics in the LSPs for the level number. Narrow metrics

can have values between 1 and 63. IS-IS can generate two TLVs, one for the adjacency and one for the IP prefix. In order to support traffic engineering, wider metrics are required. When wide metrics are used, a sec-

ond pair of TLVs are added, again, one for the adjacency and one for the IP prefix.

By default, both sets of TLVs are generated. When wide-metrics-only is configured, IS-IS only generates the

pair of TLVs with wide metrics for that level.

The **no** form of the command reverts to the default value.

IS-IS Configuration Commands

Show Commands

isis

Syntax isis [isis-instance]

Context show>router

Description This command displays information for a specified IS-IS instance.

Parameters *instance-id* — Specifies the instance ID for an IS-IS instance.

Values 1–31 **Default** 0

adjacency

Syntax adjacency [ip-address | ip-int-name | nbr-system-id] [detail]

Context show>router>isis

Description This command displays information regarding IS-IS neighbors. When no *ip-address*, *ip-int-name*, or *nbr-*

system-id are specified, then all adjacencies display.

Parameters *ip-address* — When specified, only adjacencies with that interface display.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

ip-int-name — When specified, only adjacencies with that interface display.

nbr-system-id — When pecified, only the adjacency with that ID displays.

detail — All output displays in the detailed format.

Output Standard and Detailed IS-IS Adjacency Output — The following table describes the standard and detailed command output fields for an IS-IS adjacency.

Label	Description	
Interface	Interface name associated with the neighbor.	_
System-id	Neighbor's system ID.	
Level	1-L1 only, 2-L2 only, 3-L1 and L2.	
State	Up, down, new, one-way, initializing, or rejected.	

Label	Description (Continued)
Hold	Hold time remaining for the adjacency.
SNPA	Subnetwork point of attachment, MAC address of the next hop.
Circuit type	Level on the interface L1, L2, or both.
Expires In	Number of seconds until adjacency expires.
Priority	Priority to become designated router.
Up/down transi- tions	Number of times neighbor state has changed.
Event	Event causing last transition.
Last transition	Time since last transition change.
Speaks	Supported protocols (only IP).
IP address	IP address of neighbor.
MT enab	Yes - The neighbor is advertising at least 1 non MTID#0.
Topology	 Derived from the MT TLV in the IIH MT#0, MT#2 => "Topology : Unicast, IPv6-Unicast" Native IPv4 or native IPv6 => "Topology : Unicast" Not supported MTID's => Topology line suppressed

database

Syntax database [system-id | lsp-id] [detail] [level level]

Context show>router>isis

LSP ID

Description This command displays the entries in the IS-IS link state database.

Parameters system-id — Only the LSPs related to that system-id are listed. If no system-id or lsp-id are specified, all database entries are listed.

lsp-id — Only the specified LSP (hostname) is listed. If no system-id or lsp-id are specified, all database entries are listed.

detail — All output is displayed in the detailed format.

level level — Only the specified IS-IS protocol level attributes are displayed.

Output IS-IS Database Output — The following table describes the IS-IS database output.

Label Description

LSP IDs are auto-assigned by the originating IS-IS node. The LSP ID is comprised of three sections. The first 6 bytes is the system ID for that node, followed by a single byte value for the pseudonode generated by that router, then finally, a fragment byte which starts at zero. For example, if a router's system ID is 1800.0000.0029, the first LSP ID is 1800.0000.0029.00-00. If there are too many routes, LSP ID 1800.0000.0029.00-01 is created to contain the excess routes. If the router is the Designated Intermediate System (DIS) on a broadcast network, a pseudo-node LSP is created. Usually the internal circuit ID is used to determine the ID assigned to the pseudonode. For instance, for circuit 4, a LSP pseudonode with ID 1800.0000.0029.04-00 is created. The 7750 SR OS learns hostnames and uses the hostname in place of the system ID. An example of LDP IDs are:

acc_arl.00-00 acc_arl.00-01 acc_arl.04-00

Sequence The sequence number of the LSP that allows other systems to deter-

mine if they have received the latest information from the source.

Checksum of the entire LSP packet.

Lifetime Amount of time, in seconds, that the LSP remains valid.

Attributes OV - The overload bit is set.

L1 — Specifies a Level 1 IS type.

L2 - Specifies a Level 2 IS type.

ATT – The attach bit is set. When this bit is set, the router can also act as a Level 2 router and can reach other areas.

Label	Description (Continued)
LSP Count	A sum of all the configured Level 1 and Level 2 LSPs.
LSP ID	Displays a unique identifier for each LSP composed of SysID, Pseudonode ID and LSP name.
Lifetime	Displays the remaining time until the LSP expires.
Version	Displays the version/protocol ID extension. This value is always set to 1.
Pkt Type	Displays the PDU type number.
Pkt Ver	Displays the version/protocol ID extension. This value is always set to 1.
Max Area	Displays the maximum number of area addresses supported.
Sys ID Len	Displays the length of the system ID field (0 or 6 for 6 digits).
Use Len	The actual length of the PDU.
Alloc Len	The amount of memory space allocated for the LSP.
Area Address	Displays the area addresses to which the router is connected.
Supp Protocols	Displays the data protocols that are supported.
IS-Hostname	The name of the router originating the LSP.
Virtual Flag	0- Level 1 intermediate systems report this octet as 0 to all neighbors.
	1 — Indicates that the path to a neighbor is a Level 2 virtual path used to repair an area partition.
Neighbor	Displays the routers running interfaces to which the router is connected.
Internal Reach	Displays a 32-bit metric. A bit is added for the ups and downs resulting from Level 2 to Level 1 route-leaking.
IP Prefix	Displays the IP addresses that the router knows about by externally-originated interfaces.
Metrics	Displays a routing metric used in the IS-IS link-state calculation.

interface

Syntax interface [ip-int-name | ip-address] [detail]

Context show>router>isis

Description This command shows IS-IS interface information. When no *ip-addr* or the *ip-int-name* is specified, all inter-

faces are listed.

Parameters ip-address — Only displays the interface information associated with the specified IP address.

Values ipv4-address a.b.c.d (host bits must be 0)
ipv6-address x:x:x:x:x:x:x:x: (eight 16-bit pieces)
x:x:x:x:x:x:d.d.d.d.

x: [0 — FFFF]H d: [0 — 255]D

ip-int-name — Only displays the interface information associated with the specified IP interface name.

detail — All output is given in the detailed format.

Output IS-IS Interface Output — The following table describes IS-IS interface output fields.

Label	Description
Interface	The interface name.
Level	Specifies the interface level (1, 2, or 1 and 2).
CirID	Specifies the circuit identifier.
Oper State	Up - The interface is operationally up.
	Down — The interface is operationally down.
L1/L2 Metric	Interface metric for Level 1 and Level 2, if none are set to 0.

Sample Output

	s					
Interface		Level	CircID	Oper State	L1/L2	Metric
system		L1L2		Up	10/10	
if2/1		L2	8	Up	-/10	
if2/2		L1	5	Up	10/-	
if2/3		L1	6	Up	10/-	
if2/4		L1	7	Up	10/-	
if2/5		L2	2	Up	-/10	
lag-1		L2	3	Up	-/10	
if2/8		L2	4	qU	-/10

routes

Syntax routes [ipv4-unicast | ipv6-unicast | mt mt-id-number]

Context show>router>isis

Description This command displays the routes in the IS-IS route table.

Parameters ipv4-unicast — Displays IPv4 unicast parameters.

ipv6-unicast — Displays IPv6 unicast parameters.

mt mt-id-number — Displays multi-topology parameters.

Values 0, 2

Output **IS-IS Route Output** — The following table describes IS-IS route output fields.

Label	Description
Prefix	The route prefix and mask.
Metric MT	The route's metric.
Lvl/Type	Specifies the level (1 or 2) and the route type, Internal (Int) or External (Ext).
Version	SPF version that generated route.
Nexthop	System ID of nexthop, give hostname if possible.
Hostname	Hostname for the specific system-id.

Sample Output

*A:Dut-A# show router isis routes ______

spf-log

Syntax spf-log [detail]

Context show>router>isis

Description Displays the last 20 IS-IS SFP events.

Output Router ISIS SFP Log Output — The following table describes the ISIS SPF log output fields.

Label	Description
When	Displays the timestamp when the SPF run started on the system
Duration	Displays the time (in hundredths of a second) required to complete the SPF run.
L1 Nodes	Displays the number of level 1 nodes involved in the SPF run.
L2 Nodes	Displays the number of level 2 nodes involved in the SPF run.
Event Count	Displays the number of SPF events that triggered the SPF calculation.
Log Entries	The total number of log entries.

Sample Output

A:ALA-48# show router isis spf-log				
ISIS SPF Log	:=======:	=======	=======	==========

statistics

Syntax statistics

Context show>router>isis

Description This command displays information regarding IS-IS traffic statistics.

Output IS-IS Statistics Output — This table describes IS-IS statistics output fields.

Label	Description
Purge Initiated	The number of times purges have been initiated.
SPF Runs	The number of times shortest path first calculations have been made.
LSP Regens	The count of LSP regenerations.
Requests	The number of CSPF requests made to the protocol.
Paths Found	The number of responses to CSPF requests for which paths satisfying the constraints were found.
PDU Type	The PDU type.
Received	The count of link state PDUs received by this instance of the protocol.
Processed	The count of link state PDUs processed by this instance of the protocol.
Dropped	The count of link state PDUs dropped by this instance of the protocol.
Sent	The count of link state PDUs sent out by this instance of the protocol.
Retransmitted	The count of link state PDUs that had to be retransmitted by this instance of the protocol.

Sample Output

ISIS Insta Purge Init	ance : 1 siated : 0			SPF Runs LSP Regens	
CSPF Stati Requests Paths Four	: 0			Request Dr Paths Not	-

A:ALA-A>config>router#

status

Syntax status

Context show>router>isis

Description This command displays information regarding IS-IS status.

Output IS-IS Status Output — The following table describes IS-IS status output fields.

Label	Description
System-id	Neighbor system ID.
Admin State	Up - IS-IS is administratively up.
	Down - IS-IS is administratively down.
Ipv4 Routing	Enabled - IPv4 routing is enabled.
	Disabled — IPv4 routing is disabled.
Ipv6 Routing	Disabled - IPv6 routing is disabled.
	Enabled, Native $-$ IPv6 routing is enabled.
	Enabled, Multi-topology — Multi-topology TLVs for IPv6 routing is enabled.
Multi-topology	Disabled — Multi-topology TLVs for IPv6 routing is disabled.
	Enabled - Multi-topology TLVs for IPv6 routing is enabled.
Last Enabled	The date/time when IS-IS was last enabled in the router.
Level Capability	The routing level for the IS-IS routing process.

Label	Description (Continued)
Authentication Check	True — All IS-IS mismatched protocol packets are rejected.
	False — Authentication is performed on received IS-IS protocol packets but mismatched packets are not rejected.
Authentication Type	The method of authentication used to verify the authenticity of packets sent by neighboring routers on an IS-IS interface.
Traffic Engineer- ing	Enabled — TE is enabled for the router.
	Disabled - TE is disabled so that TE metrics are not generated and are ignored when received by this node.
Graceful Restart	Enabled — Graceful restart is enabled for this instance of IS-IS on the router.
	$\label{eq:decomposition} \begin{tabular}{ll} Disabled &- Graceful restart capability is disabled for this instance of IS-IS on the router. \end{tabular}$
Ldp Sync Admin State	Indicates whether the IGP-LDP synchronization feature is enabled or disabled on all interfaces participating in the OSPF routing protocol.

Sample Output

=======================================	:============			

Clear Commands

isis

Syntax isis [isis-instance]

Context clear>router>isis

Description This command enables the context to clear and reset ISIS protocol entities.

Parameters *isis-instance* — Specifies the IS-IS instance.

Values 1 — 31

adjacency

Syntax adjacency [system-id]

Context clear>router>isis

Description This command clears and resets the entries from the IS-IS adjacency database.

Parameters system-id — When the system ID is entered, only the specified entries are removed from the IS-IS adjacency

database.

database

Syntax database [system-id]

Context clear>router>isis

Description This command removes the entries from the IS-IS link-state database which contains information about

PDUs.

Parameters system-id — When the system ID is entered, only the specified entries are removed from the IS-IS link-state

database.

export

Syntax export

Context clear>router>isis

Description This command re-evaluates route policies participating in the export mechanism, either as importers or

exporters of routes.

spf-log

Syntax spf-log

Context clear>router>isis

Description This command clears the SPF log.

statistics

Syntax statistics

Context clear>router>isis

Description This command clears and resets IS-IS statistics.

Debug Commands

adjacency

Syntax [no] adjacency [ip-int-name | ip-address | nbr-system-id]

Context debug>router>isis

Description This command enables debugging for IS-IS adjacency.

The **no** form of the command disables debugging.

cspf

Syntax [no] cspf

Context debug>router>isis

Description This command enables debugging for IS-IS cspf.

The **no** form of the command disables debugging.

graceful-restart

Syntax [no] graceful-restart

Context debug>router>isis

Description This command enables debugging for IS-IS graceful-restart.

The **no** form of the command disables debugging.

interface

Syntax interface [ip-int-name | ip-address]

no interface

Context debug>router>isis

Description This command enables debugging for IS-IS interface.

The **no** form of the command disables debugging.

leak

Syntax leak [ip-address]

no leak

Context debug>router>isis

Description This command enables debugging for IS-IS leaks.

The **no** form of the command disables debugging.

Isdb

Syntax [no] Isdb [level-number] [system-id | lsp-id]

Context debug>router>isis

Description This command enables debugging for Link State DataBase (LSDB).

The **no** form of the command disables debugging.

misc

Syntax [no] misc

Context debug>router>isis

Description This command enables debugging for IS-IS misc.

The no form of the command disables debugging.

packet

Syntax packet [packet-type] [ip-int-name | ip-address] [detail]

Context debug>router>isis

Description This command enables debugging for IS-IS packets.

The **no** form of the command disables debugging.

Debug Commands

rtm

Syntax rtm [ip-address]

no rtm

Context debug>router>isis

Description This command enables debugging for IS-IS route table manager (RTM).

The **no** form of the command disables debugging.

spf

Syntax [no] spf [level-number] [system-id]

Context debug>router>isis

Description This command enables debugging for IS-IS SFP.

The no form of the command disables debugging.

In This Chapter

This chapter provides information to configure BGP.

Topics in this chapter include:

- BGP Overview on page 520
 - → BGP Communication on page 520
 - → Group Configuration and Peers on page 522
 - → Hierarchical Levels on page 523
 - → Route Reflection on page 523
 - → BGP Route Tunnel on page 528
 - → RSVP-TE LSP Shortcut for BGP Next-Hop Resolution on page 530
 - → BGP Confederations on page 532
 - → Command Interactions and Dependencies on page 534
 - Changing the Autonomous System Number on page 534
 - Changing the Router ID at the Configuration Level on page 536
 - Changing the Local AS Number on page 535
 - Hold Time and Keep Alive Timer Dependencies on page 536
 - Import and Export Route Policies on page 537
 - Route Damping and Route Policies on page 537
 - AS Override on page 537
 - TTL Security for BGP and LDP on page 538
- BGP Configuration Process Overview on page 539
- Configuration Notes on page 540

BGP Overview

Border Gateway Protocol (BGP) is an inter-autonomous system routing protocol. An autonomous system is a network or a group of routers logically organized and controlled by a common network administration. BGP enables routers to exchange network reachability information, including information about other ASs that traffic must traverse to reach other routers in other ASs. In order to implement BGP, the AS number must be specified in the config>router context. A TiMOS BGP configuration must contain at least one group and include information about at least one neighbor (peer).

AS paths are the routes to each destination. Other attributes, such as the path's origin, the multiple exit discriminator (MED), the system's route preference, aggregation, confederations, route reflection, and communities included in the AS path are called path attributes. When BGP interprets routing and topology information, loops can be detected and eliminated. Route preference for routes learned from the configured peer(s) can be enabled among groups of routes to enforce administrative preferences and routing policy decisions.

BGP Communication

There are two types of BGP peers, internal BGP (IBGP) and external BGP (EBGP) (Figure 17).

- Within an AS, IBGP is used to communicate with peers within an autonomous system. Routes received from a SR-Series router in the same autonomous system are not advertised to other routers in the same autonomous system but can be advertised to an EBGP peer.
- Outside of an AS or between ASs, EBGP is used to communicate with peers in different autonomous systems. Routes received from an router in a different AS can be advertised to both EBGP and IBGP peers.

Autonomous systems share routing information, such as routes to each destination and information about the route or AS path, with other ASs using BGP. Routing tables contain lists of known routers, reachable addresses, and associated path cost metrics to each router. BGP uses the information and path attributes to compile a network topology.

Message Types

Four message types are used by BGP to negotiate parameters, exchange routing information and indicate errors. They are:

• Open Message — After a transport protocol connection is established, the first message sent by each side is an Open message. If the Open message is acceptable, a Keepalive

message confirming the Open is sent back. Once the Open is confirmed, Update, Keepalive, and Notification messages can be exchanged.

Open messages consist of the BGP header and the following fields:

- → Version The current BGP version number is 4.
- → Local AS number The autonomous system number is configured in the config>router context.
- → Hold time Configure the maximum time BGP will wait between successive messages (either keep alive or update) from its peer, before closing the connection. Configure the local hold time with in the config>router>bgp context.
- → BGP identifier IP address of the BGP system or the router ID. The router ID must be a valid host address.
- Update Message Update messages are used to transfer routing information between BGP peers. The information contained in the packet can be used to construct a graph describing the relationships of the various autonomous systems. By applying rules, routing information loops and some other anomalies can be detected and removed from the inter-AS routing,

The update messages consist of a BGP header and the following optional fields:

- → Unfeasible routes length The field length which lists the routes being withdrawn from service because they are considered unreachable.
- → Withdrawn routes The associated IP address prefixes for the routes withdrawn from service.
- → Total path attribute length The total length of the path field that provides the attributes for a possible route to a destination.
- → Path attributes The path attributes presented in variable length TLV format.
- → Network layer reachability information (NLRI) IP address prefixes of reachability information.
- Keepalive Message Keepalive messages, consisting of only a 19 octet message header, are exchanged between peers frequently so hold timers do not expire. The keepalive messages determine if a link is unavailable.
- Notification A Notification message is sent when an error condition is detected. The
 peering session is terminated and the BGP connection (TCP connection) is closed
 immediately after sending it.

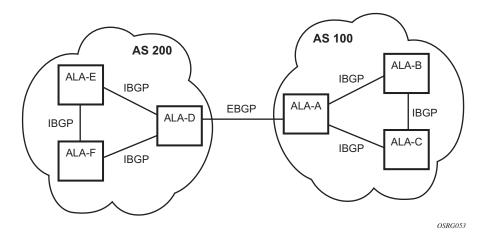

Figure 17: BGP Configuration

Group Configuration and Peers

To enable BGP routing, participating routers must have BGP enabled and be assigned to an autonomous system and the neighbor (peer) relationships must be specified. A router can belong to only one AS. TCP connections must be established in order for neighbors to exchange routing information and updates. Neighbors exchange BGP open messages that includes information such as AS numbers, BGP versions, router IDs, and hold-time values. Keepalive messages determine if a connection is established and operational. The hold-time value specifies the maximum time BGP will wait between successive messages (either keep alive or update) from its peer, before closing the connection.

In BGP, peers are arranged into groups. A group must contain at least one neighbor. A neighbor must belong to a group. Groups allow multiple peers to share similar configuration attributes.

Although neighbors do not have to belong to the same AS, they must be able to communicate with each other. If TCP connections are not established between two neighbors, the BGP peering will not be established and updates will not be exchanged.

Peer relationships are defined by configuring the IP address of the routers that are peers of the local BGP system. When neighbor and peer relationships are configured, the BGP peers exchange update messages to advertise network reachability information.

Hierarchical Levels

BGP parameters are initially applied on the global level. These parameters are inherited by the group and neighbor (peer) levels. Parameters can be modified and overridden on a level-specific basis. BGP command hierarchy consists of three levels:

- Global level
- Group level
- Neighbor level

Many of the hierarchical BGP commands can be modified on different levels. The most specific value is used. That is, a BGP group-specific command takes precedence over a global BGP command. A neighbor-specific statement takes precedence over a global BGP and group-specific command; for example, if you modify a BGP neighbor-level command default, the new value takes precedence over group- and global-level settings.

NOTE: Careful planning is essential to implement commands that can affect the behavior of global, group, and neighbor-levels. Because the BGP commands are hierarchical, analyze the values that can disable features on the global or group levels that must be enabled at the neighbor level. For example, if you enable the damping command on the global level but want it disabled only for a specific neighbor (not for all neighbors within the group), you cannot configure a double-no command (no no damping) to enable the feature.

Route Reflection

In a standard BGP configuration, all BGP speakers within an AS, must have full BGP mesh to ensure that all externally learned routes are redistributed through the entire AS. IBGP speakers do not re-advertise routes learned from one IBGP peer to another IBGP peer. If a network grows, scaling issues could emerge because of the full mesh configuration requirement. Instead of peering with all other IBGP routers in the network, each IBGP router only peers with a router configured as a route reflector.

Route reflection circumvents the full mesh requirement but maintains the full distribution of external routing information within an AS. Route reflection is effective in large networks because it is manageable, scalable, and easy to implement. Route reflection is implemented in autonomous systems with a large internal BGP mesh to reduce the number of IBGP sessions required within an AS.

A large AS can be sub-divided into smaller ASs called *clusters*. Route clusters are similar to these sub-autonomous systems and include route reflector(s) and clients. Each cluster contains at least one route reflector which is responsible for redistributing route updates to all clients. Route reflector clients do not need to maintain a full peering mesh between each other. They only require

a peering to the route reflector(s) in their cluster. The route reflectors must maintain a full peering mesh between all non-clients within the AS.

Each route reflector must be assigned a cluster ID and specify which neighbors are clients and which are non-clients to determine which neighbors should receive reflected routes and which should be treated as a standard IBGP peer. Additional configuration is not required for the route reflector besides the typical BGP neighbor parameters.

BGP speakers within the AS who are not peers with the route reflector are called nonclients. Non-clients are peers to a route reflector but do not understand the route reflector attributes. Several BGP-speaking routers can peer with a route reflector. A route reflector forms peer connections to other route reflectors.

Figure 18 displays a simple configuration with several IBGP SR-Series s. When ALA-A receives a route from ALA-1 (an external neighbor), it must advertise route information to ALA-B and ALA-C. To prevent loops, IBGP learned routes are not re-advertised to other IBGP peers.

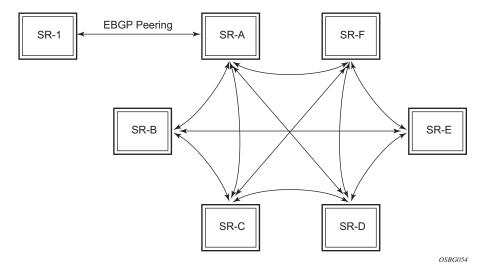

Figure 18: Fully Meshed BGP Configuration

When route reflectors are configured, the routers within a cluster do not need to be fully meshed. Figure 18 depicts a fully meshed network and Figure 19 depicts the same network but with route reflectors configured to minimize the IBGP mesh between SR-A, SR-B, SR-C, and SR-D. SR-A, configured as the route reflector, is responsible for redistributing route updates to clients SR-B, SR-C, and SR-D. IBGP peering between SR-B, SR-C and SR-D is not necessary because even IBGP learned routes are reflected to the route reflector's clients.

In Figure 19, SR-E and SR-F are shown as non-clients of the route reflector. As a result, a full mesh of IBGP peerings must be maintained between, SR-A, SR-E and SR-F.

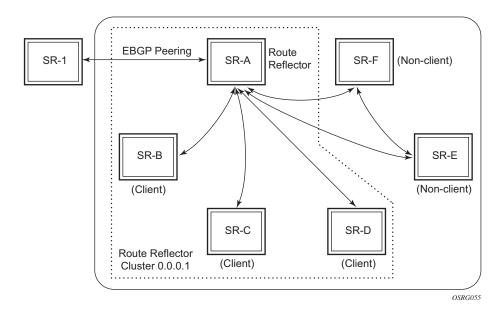

Figure 19: BGP Configuration with Route Reflectors

BGP speakers within an AS that are not configured as reflectors are considered to be client peers. Non-client peers are other routers in the AS. A route reflector enables communication between the clients and non-client peers. Route-reflector-to-client-peer configurations do not need to be fully meshed but non-client peers need to be fully meshed within an AS.

A grouping, called a cluster, is composed of a route reflector and its client peers. A cluster ID identifies the grouping unless specific BGP peerings are configured. A cluster's clients do not share information messages with other peers outside the cluster. Multiple route reflectors can be configured within a cluster for redundancy. A router assumes the role as a route reflector by configuring the cluster cluster-id command. No other command is required unless you want to disable reflection to specific clients.

BGP Overview

When a route reflector receives an advertised route, depending on the sender and neighbors (peers), it selects the best path. Routes received from an EBGP peer are advertised, unmodified to retain next-hop information, to all clients and non-client peers in the AS. Routes received from a non-client peer are advertised to all clients in the AS. Routes received from a client are advertised to all clients and non-client peers.

Fast External Failover

Fast external failover on a group and neighbor basis is supported. For eBGP neighbors, this feature controls whether the router should drop an eBGP session immediately upon an interface-down event, or whether the BGP session should be kept up until the hold-time expires.

When fast external failover is disabled, the eBGP session stays up until the hold-time expires or the interface comes back up. If the BGP routes become unreachable as a result of the down IP interface, BGP withdraws the unavailable route immediately from other peers.

Sending of BGP Communities

The capability to explicitly enable or disable the sending of the BGP community attribute to BGP neighbors, other than through the use of policy statements, is supported.

This feature allows an administrator to enable or disable the sending of BGP communities to an associated peer. This feature overrides communities that are already associated with a given route or that may have been added via an export route policy. In other words, even if the export policies leave BGP communities attached to a given route, when the disable-communities feature is enabled, no BGP communities are advertised to the associated BGP peers.

BGP Route Tunnel

BGP-tunnel defines a method to distribute MPLS labels associated with a route advertisement. BGP speakers exchanging routes piggyback a label based on Multi-protocol Extensions Attribute. The label is encoded in the NLRI field and SAFI is used to indicate that the NLRI contains a label. Labeled route update is only exchanged between BGP speakers supporting AFI/SAFI for MPLS Label Capability.

BGP speakers not adjacent to each other may choose LDP tunnels to reach BGP labeled route next-hop. Client applications using BGP tunnels must use two labels (BGP tunnel and LDP label) to reach BGP next-hop besides carrying other labels in stack to identify the VC/VPN at far-end. The next-hop BGP node can either resolve its own local LDP LSPs to reach its next-hop for BGP tunnel, or it may terminate locally.

If BGP speaker nodes are adjacent to each other (for example, ASBRs running eBGP session) and have exchange labeled routes, then only the BGP route label may be used to forward traffic towards the next-hop node. If the BGP route tunnel transits through multiple AS, then each AS segment would have two labels. The last BGP segment ASBR may select to have either one (LDP) or two (BGP + LDP) labels to reach far-end (for optimization, only one label is used in the last AS segment on the 7750 SR/7710 SR platform).

SDP Using BGP Route Tunnel

SDP is enhanced to use BGP route tunnel to extend inter-AS support for L2VPN services. An SDP can be configured based on service transport method (for example, GRE or MPLS tunnel). MPLS SDP support is enhanced to allow a BGP route tunnel to reach the far-end PE.

A single method of tunneling is allowed per SDP (for example, LDP, RSVP-TE LSP or BGP route tunnel). BGP route tunnel method is excluded if multi-mode transport is enabled for an SDP.

For the inter-AS far-end PE, next-hop for BGP route tunnel must be one of the local ASBR. The LSP type selected to reach the local ASBR (BGP labeled route next-hop) must be configured under the BGP global context. LDP must be supported to provide transport LSP to reach the BGP route tunnel next-hop.

Only BGP route labels can be used to transition from ASBR to the next-hop ASBR. The global BGP route tunnel transport configuration option must be entered to select an LSP to reach the PE node from ASBR node. On the last BGP segment, both "BGP+LDP" and LDP routes may be available to reach the far-end PE from the ASBR node. LDP LSP must be preferred due to higher protocol priority. This leads to just one label besides other labels in stack to identify VC/VPN at far-end PE nodes.

ECMP and BGP Route Tunnels

ECMP is only available for BGP route tunnels and not the transport LSP that is used to resolve BGP next-hop. If multiple LSP next-hops are available, then only the first next-hop is used and the rest ignored.

Layer 2 Services and BGP Route Tunnel

MPLS transport tunnel per VPLS/VLL instance is enabled by an explicit MPLS-SDP configuration for each far-end PE. For BGP-AD based VPLS, SDP must be manually configured to reach the far-end.

BGP Route Tunnel SDP Binding

BGP route tunnel based SDP binding is allowed for VPLS and VLL services. Any service using BGP SDP must presume a two label stack to compute SDP MTU.

BGP Route Tunnel Based BGP-AD Support

LDP is the only supported transport method with pw-template.

RSVP-TE LSP Shortcut for BGP Next-Hop Resolution

RSVP-TE shortcut for BGP next-hop resolution is enabled by entering the **config>router>bgp>igp-shortcut rsvp** command at the BGP protocol level.

This command instructs BGP to search for the best metric RSVP LSP to the /32 address of the BGP next-hop. This address can correspond to the system interface or to another loopback used by the BGP instance on the remote node as its router-id. The LSP metric is provided by MPLS in the tunnel table.

In order to provide fallback from RSVP-TE LSP shortcut to an LDP LSP shortcut and then to the IGP next-hop, the above new command is extended to support the following options:

config>router>bgp>igp-shortcut [ldp | rsvp-te | mpls][disallow-igp]

The **ldp** option instructs BGP to search for an LDP LSP with a FEC prefix corresponding to the /32 address of the BGP next-hop. This deprecates the existing ldp-shortcut command under BGP. Support for the older command will be provided over a number of releases to allow old config files to execute.

The **rsvp-te** option instructs BGP to search for the best metric RSVP LSP to the /32 address of the BGP next-hop. This address can correspond to the system interface or to another loopback used by the BGP instance on the remote node as its router-id. The LSP metric is provided by MPLS in the tunnel table.

The **mpls** option instructs BGP to first attempt to resolve the BGP next-hop to an RSVP LSP. If no RSVP LSP exists or if the existing ones are down, BGP will automatically search for the LDP LSP with a FEC prefix corresponding to the same /32 prefix in the tunnel table and will resolve the BGP next-hop to it.

The **disallow-igp** option also deprecates the existing one under BGP. It continues to work transparently regardless of which type of LSP shortcut, RSVP or LDP, is being used by BGP at any given time. When this option is enabled and if an LSP shortcut of the configured type is not available, the IGP next-hop route will not be used for the BGP next-hop resolution.

Core IPv4 Prefix Resolution

The recursive lookup of an IPv4 prefix in RTM will result first in the BGP next-hop determination for the packet's prefix and then the IGP next-hop resolution for the BGP next-hop prefix. When the **igp-shortcut rsvp-te** option is enabled in BGP, the IGP resolution for the BGP next-hop will provide the best metric RSVP LSP to the BGP next-hop address as the next-hop shortcut. This RSVP shortcut next-hop is installed as a route in the ingress IOM tunnel table.

When an IPv4 packet for this prefix is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the ingress IOM lookup of the packet will result in sending the packet labeled with the label stack corresponding to the NHLFE of the RSVP LSP.

The failure of a used RSVP LSP shortcut triggers a new resolution which will result in installing a new route in the ingress IOM tunnel table over another RSVP LSP shortcut if available, or an LDP LSP if the **igp-shortcut mpls** option is enabled, or a regular IP next-hop if the **disallow-igp** option is disabled.

Handling of Control Packets

All control plane packets that require an RTM lookup and whose destination is reachable over a BGP next-hop resolved to an RSVP shortcut will be forwarded over the shortcut. This effectively excludes the vast majority of control packets which have destinations within an autonomous system. The exceptions are for locally generated or in transit ICMP ping and trace route messages for destinations outside of the local autonomous system.

BGP Confederations

In a standard BGP configuration, all BGP speakers, within an autonomous system (AS), have a full mesh of BGP peerings to insure all externally learned routes are redistributed through out the entire AS. This is due to the fact that IBGP speakers do not re-advertise routes learned from one IBGP peer to another IBGP peer. However, as a network grows, scaling issues emerge due to the full mesh requirement. The BGP confederation feature is one method to alleviate the full mesh requirement while still maintaining the full distribution of external routing information within an AS.

To form BGP confederations, an AS is logically divided into smaller groupings called subconfederations. Each sub-confederation must maintain a full mesh of IBGP peerings between all members of the confederation.

The BGP confederation is not visible to outside autonomous systems. All confederation specific path attributes are stripped from route updates before they are advertised to external BGP peers.

Sub-confederation ASs have EBGP-type peers to other sub-confederation ASs within the confederation. They exchange routing updates as if they were using IBGP. Parameter values such as next hop, metric, and local preference settings are preserved. The confederation appears and behaves like a single AS.

Confederations have the following characteristics:

- A large AS can be sub-divided into smaller ASs (sub-confederations).
- Inside each smaller AS, routing within each sub-confederation is accomplished via IBGP.
- EBGP is used to communicate *between* sub-confederations.
- BGP speakers within a sub-confederation must be fully meshed.
- Each sub-confederation (member) of the confederation has a different AS number. The AS numbers used are typically in the private AS range of 64512 65535.

To migrate from a non-confederation configuration to a confederation configuration requires a major configuration change on each BGP speaker in the AS. Setting BGP policies to select an optimal path through a confederation requires other BGP modifications.

Route Selection Criteria

For each prefix in the routing table, the routing protocol selects the best path. Then, the best path is compared to the next path in the list until all paths in the list are exhausted. The following parameters are used to determine the best path:

- 1. Routes are not considered if they are unreachable.
- 2. An RTM's preference is lowered as well as the hierarchy of routes from a different protocol. The lower the preference the higher the chance of the route being the active route.
- 3. Routes with higher local preference have preference.
- 4. Routes with the shorter AS path have preference.
- 5. Routes with the lower origin have preference. IGP = 0 EGP = 1 INCOMPLETE = 2
- 6. Routes with the lowest MED metric have preference. Routes with no MED value are exempted from this step unless always-compare-med is configured.
- 7. Routes learned by an EBGP peer rather than those learned from an IBGP peer are preferred.
- 8. Routes with the lowest IGP cost to the next-hop path attribute are preferred.
- 9. Routes with the lowest BGP-ID are preferred.
- 10. Routes with shortest cluster list are preferred.
- 11. Routes with lowest next-hop IP address are preferred.

Note: For BGP-VPN routes with the same prefix but with a different Route Distinguisher (RD) that are imported in a VRF, if ECMP is not enabled in that VRF, the above selection criteria are used until parameter 8. If all selection criteria are still the same after that point, the last updated route will be selected.

IP-VPNs MSE Direct Route Comparison

IP-VPNs MSE direct route comparison of BGP and MP-BGP learned routes provides the ability to compare a route received from a CE peer (inside the VPRN context) to the same route prefix received as a BGP VPN-IPv4 update from a PE peer. This is required when a CE router is dual homed and advertises the same customer route prefix to two (or more) PE peers. Each PE router needs to choose one of the prefixes, which was done previously, based on the Route Table Preference as opposed to comparing the BGP attributes. The BGP route decision process takes into account the following attribute values of the two routes to decide the best route to install in the VRF table:

- 1. Routes are not considered if they are unreachable.
- 2. Routes of the protocol with the lowest preference value are selected.
- 3. BGP routes with higher local preference have preference.
- 4. BGP routes with the shorter AS path have preference. (This is checked independent of the as-path-ignore parameter.)
- 5. Routes with the lowest origin type have preference (where IGP is lower than EGP and EGP is lower than INCOMPLETE).
- 6. BGP routes with the lowest MED metric have preference. (If MED values are present, they are checked independent of the always-compare-med parameter.)
- 7. BGP CE-PE learned routes are preferred over MP-BGP learned routes.

Command Interactions and Dependencies

This section highlights the BGP command interactions and dependencies which are important for configuration or operational maintenance of 7750 SR routers. Topics covered in this section are:

- Changing the Autonomous System Number on page 534
- Changing a Confederation Number on page 536
- Changing the Router ID at the Configuration Level on page 536
- Changing the Local AS Number on page 535
- Hold Time and Keep Alive Timer Dependencies on page 536
- Import and Export Route Policies on page 537
- Route Damping and Route Policies on page 537

Note that this information can be found in the BGP Command Reference on page 567 which provides detailed descriptions of the configuration commands.

Changing the Autonomous System Number

If the AS number is changed on a router with an active BGP instance, the new AS number will not be used until the BGP instance is restarted either by administratively disabling or enabling the BGP instance or by rebooting the system with the new configuration.

Changing the Local AS Number

Changing the local AS of an active BGP instance:

- At the global level causes the BGP instance to restart with the new local AS number.
- At the group level causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number.
- At the neighbor level causes BGP to re-establish the peer relationship with the new local AS number.

Changing a Confederation Number

Changing the a confederation value on an active BGP instance will not restart the protocol. The change will take affect when the BGP protocol is (re) initialized.

Changing the Router ID at the Configuration Level

If you configure a new router ID in the config>router-id context, protocols are not automatically restarted with the new router ID. The next time a protocol is (re) initialized the new router ID is used. An interim period of time can occur when different protocols use different router IDs.

Hold Time and Keep Alive Timer Dependencies

The BGP hold time specifies the maximum time BGP will wait between successive messages (either keep alive or update) from its peer, before closing the connection. This configuration parameter can be set at three levels. The most specific value is used.

- Global level applies to all peers
- Group level applies to all peers in group
- Neighbor level only applies to specified peer

Although the keep alive time can be user specified, the configured keep alive timer is overridden by the value of hold time under the following circumstances:

- If the hold time specified is less than the configured keep alive time, then the operational keep alive time is set to one third of the specified hold time; the configured keep alive time is unchanged.
- If the hold time is set to zero, then the operational value of the keep alive time is set to zero; the configured keep alive time is unchanged. This means that the connection with the peer will be up permanently and no keep alive packets are sent to the peer.

If the hold time or keep alive values are changed, the changed timer values take effect when the new peering relationship is established. Changing the values cause the peerings to restart. The changed timer values are used when re-negotiating the peer relationship.

Import and Export Route Policies

Import and export route policy statements are specified for BGP on the global, group, and neighbor level. Up to five unique policy statement names can be specified in the command line per level. The most specific command is applied to the peer. Defining the policy statement name is not required before being applied. Policy statements are evaluated in the order in which they are specified within the command context until the first matching policy statement is found.

The import and export policies configured on different levels are not cumulative. The most specific value is used. An import or export policy command specified on the neighbor level takes precedence over the same command specified on the group or global level. An import or export policy command specified on the group level takes precedence over the same command specified on the global level.

Route Damping and Route Policies

To prevent BGP systems from sending excessive route changes to peers, BGP route damping can be implemented. Damping can reduce the number of update messages sent between BGP peers, to reduce the load on peers, without adversely affecting the route convergence time for stable routes.

The damping profile defined in the policy statement is applied to control route damping parameters. Route damping characteristics are specified in a route damping profile and are referenced in the action for the policy statement or in the action for a policy entry. Damping can be specified at the global, group, or neighbor level with the most specific command applied to the peer.

AS Override

The BGP-4 Explicit AS Override simplifies the use of the same AS number (ASN) across multiple RFC 2547 VPRN sites.

The Explicit AS Override feature can be used in VPRN scenarios where a customer is running BGP as the PE-CE protocol and some or all of the CE locations are in the same Autonomous System (AS). With normal BGP, two sites in the same AS would not be able to reach each other directly since there is an apparent loop in the ASPATH.

With AS Override enabled on an egress eBGP session, the Service Provider network can rewrite the customer ASN in the ASPATH with its own ASN as the route is advertised to the other sites within the same VPRN.

TTL Security for BGP and LDP

The BGP TTL Security Hack (BTSH) was originally designed to protect the BGP infrastructure from CPU utilization-based attacks. It is derived on the fact that the vast majority of ISP eBGP peerings are established between adjacent routers. Since TTL spoofing is considered nearly impossible, a mechanism based on an expected TTL value can provide a simple and reasonably robust defense from infrastructure attacks based on forged BGP packets.

While TSH is most effective in protecting directly connected peers, it can also provide a lower level of protection to multi-hop sessions. When a multi-hop BGP session is required, the expected TTL value can be set to 255 minus the configured range-of-hops. This approach can provide a qualitatively lower degree of security for BGP (i.e., a DoS attack could, theoretically, be launched by compromising a box in the path). However, BTSH will catch a vast majority of observed distributed DoS (DDoS) attacks against eBGP. For further information, refer to draft-gill-btsh-xx.txt, *The BGP TTL Security Hack (BTSH)*.

TSH can be used to protect LDP peering sessions as well. For details, see draft-chen-ldp-ttl-xx.txt, *TTL-Based Security Option for LDP Hello Message*.

The TSH implementation supports the ability to configure TTL security per BGP/LDP peer and evaluate (in hardware) the incoming TTL value against the configured TTL value. If the incoming TTL value is less than the configured TTL value, the packets are discarded and a log is generated.

BGP Configuration Process Overview

Figure 20 displays the process to provision basic BGP parameters.

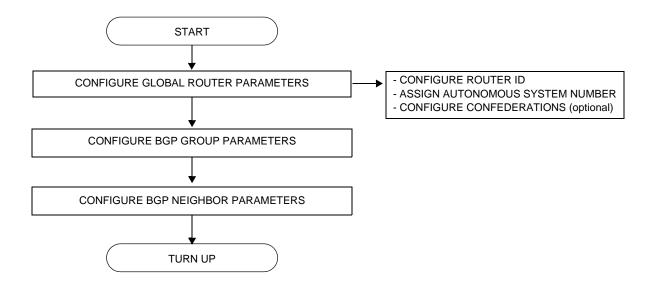

Figure 20: BGP Configuration and Implementation Flow

Configuration Notes

This section describes BGP configuration caveats.

General

- Before BGP can be configured, the router ID (a valid host address, not the MAC address default) and autonomous system global parameters must be configured.
- BGP instances must be explicitly created on each BGP peer. There are no default BGP instances on a 7750 SR.

BGP Defaults

The following list summarizes the BGP configuration defaults:

- By default, the 7750 SR is not assigned to an AS.
- A BGP instance is created in the administratively enabled state.
- A BGP group is created in the administratively enabled state.
- A BGP neighbor is created in the administratively enabled state.
- No BGP router ID is specified. If no BGP router ID is specified, BGP uses the router system interface address.
- The TiMOS BGP timer defaults are the values recommended in IETF drafts and RFCs (see BGP MIB Notes on page 541)
- If no *import* route policy statements are specified, then all BGP routes are accepted.
- If no *export* route policy statements specified, then all BGP routes are advertised and non-BGP routes are not advertised.

BGP MIB Notes

The TiMOS implementation of the RFC 1657 MIB variables listed in Table 14 differs from the IETF MIB specification.

Table 14: TiMOS and IETF MIB Variations

MIB Variable	Description	RFC 1657 Allowed Values	TiMOS Allowed Values
bgpPeerMinASOrigina- tionInterval	Time interval in seconds for the MinASOriginationInterval timer. The suggested value for this timer is 15 seconds.	1 — 65535	2 — 255
bgpPeerMinRouteAdver- tisementInterval	Time interval in seconds for the MinRouteAdvertisementInterval timer. The suggested value for this timer is 30.	1 — 65535	2 — 255

If SNMP is used to set a value of X to the MIB variable in Table 15, there are three possible results:

Table 15: MIB Variable with SNMP

Condition	Result
X is within IETF MIB values and X is within TiMOS values	SNMP set operation does not return an error MIB variable set to X
X is within IETF MIB values and X is outside TiMOS values	SNMP set operation does not return an error MIB variable set to "nearest" TiMOS supported value (e.g. TiMOS range is $2-255$ and $X=65535$, MIB variable will be set to 255) Log message generated
X is outside IETF MIB values and X is outside TiMOS values	SNMP set operation returns an error

Configuration Notes

When the value set using SNMP is within the IETF allowed values and outside the TiMOS values as specified in Table 14 and Table 15, a log message is generated.

The log messages that display are similar to the following log messages:

Sample Log Message for setting bgpPeerMinASOriginationInterval to 65535

576 2006/11/12 19:45:48 [Snmpd] BGP-4-bgpVariableRangeViolation: Trying to set bgpPeerMinASOrigInt to 65535 - valid range is [2-255] - setting to 255

Sample Log Message for setting bgpPeerMinASOriginationInterval to 1

594 2006/11/12 19:48:05 [Snmpd] BGP-4-bgpVariableRangeViolation: Trying to set bgpPeerMinASOrigInt to 1 - valid range is [2-255] - setting to 2

Sample Log Message for setting bgpPeerMinRouteAdvertisementInterval to 256

535 2006/11/12 19:40:53 [Snmpd] BGP-4-bgpVariableRangeViolation: Trying to set bgpPeerMinRouteAdvInt to 256 - valid range is [2-255] - setting to 255

Sample Log Message for setting bgpPeerMinRouteAdvertisementInterval to 1

566 2006/11/12 19:44:41 [Snmpd] BGP-4-bgpVariableRangeViolation: Trying to set bgpPeerMinRouteAdvInt to 1 - valid range is [2-255] - setting to 2

Configuring BGP with CLI

This section provides information to configure BGP using the command line interface.

BGP Configuration Overview

Preconfiguration Requirements

Before BGP can be implemented, the following entities must be configured:

- The autonomous system (AS) number for the router.
 - An AS number is a globally unique value which associates a router to a specific autonomous system. This number is used to exchange exterior routing information with neighboring ASs and as an identifier of the AS itself. Each router participating in BGP must have an AS number specified.
 - In order to implement BGP, the AS number must be specified in the config>router context.
- Router ID The router ID is the IP address of the local router. The router ID identifies a packet's origin. The router ID must be a valid host address.

BGP Hierarchy

BGP is configured in the config>router>bgp context. Three hierarchical levels are included in BGP configurations:

- Global level
- Group level
- Neighbor level

Commands and parameters configured on the global level are inherited to the group and neighbor levels although parameters configured on the group and neighbor levels take precedence over global configurations.

Internal and External BGP Configurations

A BGP system is comprised of ASs which share network reachability information. Network reachability information is shared with adjacent BGP systems neighbors. Further logical groupings are established within BGP systems within ASs. BGP supports two types of routing information exchanges:

• External BGP (EBGP) is used between ASs.

EBGP speakers peer to different ASs and typically share a subnet. In an external group, the next hop is dependent upon the interface shared between the external peer and the specific neighbor. The multihop command must be specified if an EBGP peer is more than one hop away from the local router. The next hop to the peer must be configured so that the two systems can establish a BGP session.

• Internal BGP (IBGP) is used within an AS.

An IBGP speaker peers to the same AS and typically does not share a subnet. Neighbors do not have to be directly connected to each other. Since IBGP peers are not required to be directly connected, IBGP uses the IGP path (the IP next-hop learned from the IGP) to reach an IBGP peer for its peering connection.

BGP Confederations

Follow these steps to configure a confederation:

- 1. Configure the autonomous system number as the local confederation AS.
- 2. Configure the BGP confederation members using the confederation command in the config>router context.
- 3. Configure the full mesh of IBGP peering within the (local) sub-confederation.
- 4. Configure one or more peerings to other neighboring sub-confederations.

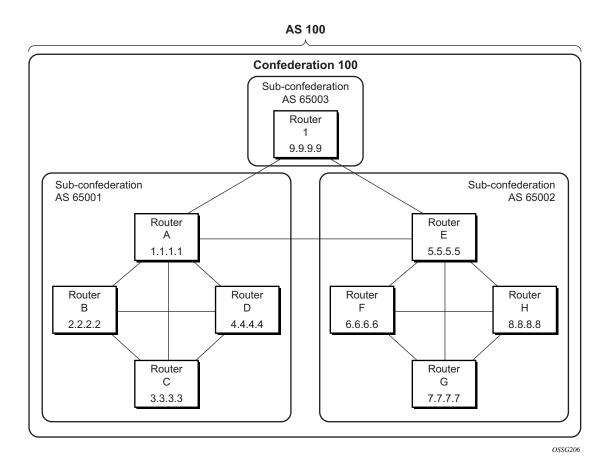

Figure 21: Confederation Network Diagram Example

The following configuration displays the minimum BGP configuration for routers (7750 SR-Series) in Confederation AS 65001 outlined in Figure 22. Routers ALA-A and ALA-E are route reflectors.

```
ALA-A

config router

autonomous-system 65001

confederation 100 members 65001 65002 65003

bgp

                  exit
                  neighbor 9.9.9.9
                      peer-as 65003
                  exit
             exit
         exit
    exit
ALA-D
    config router
         autonomous-system 65001
         confederation 100 members 65001 65002 65003
             group confed1
                  peer-as 65001
                  neighbor 1.1.1.1
                  exit
                  neighbor 2.2.2.2
                  exit
                  neighbor 3.3.3.3
                  exit
             exit
         exit
    exit
ROUTER 1
    config router
         autonomous-system 65003
         confederation 100 members 65001 65002 65003
             group confed1
                  peer-as 65001
                  neighbor 1.1.1.1
                  exit
                  neighbor 5.5.5.5
                      peer-as 65002
                  exit
             exit
         exit
    exit
```

BGP Route Reflectors

In a standard BGP configuration, all BGP speakers within an AS must have a full BGP mesh to insure that all externally learned routes are redistributed through the entire AS. IBGP speakers do not re-advertise routes learned from one IBGP peer to another IBGP peer. If a network grows, scaling issues could emerge because of the full mesh configuration requirement. Route reflection circumvents the full mesh requirement but still maintains the full distribution of external routing information within an AS.

Autonomous systems using route reflection arrange BGP routers into groups called *clusters*. Each cluster contains at least one route reflector which is responsible for redistributing route updates to all clients. Route reflector clients do not need to maintain a full peering mesh between each other. They only require a peering to the route reflector(s) in their cluster. The route reflectors must maintain a full peering mesh between all non-clients within the AS.

Each route reflector must be assigned a cluster ID and specify which neighbors are clients and which are non-clients to determine which neighbors should receive reflected routes and which should be treated as a standard IBGP peer. Additional configuration is not required for the route reflector besides the typical BGP neighbor parameters.

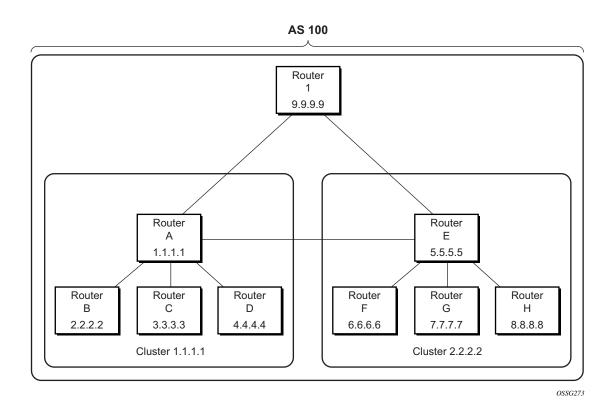

Figure 22: Route Reflection Network Diagram Example

The following configuration displays the minimum BGP configuration for routers in Cluster 1.1.1.1 outlined in Figure 22.

```
ALA-A
    config router bgp
         group cluster1
             peer-as 100
              cluster 1.1.1.1
              neighbor 2.2.2.2
              exit
              neighbor 3.3.3.3
              exit
              neighbor 4.4.4.4
              exit
         exit
         group RRs
              peer-as 100
              neighbor 5.5.5.5
              exit
              neighbor 9.9.9.9
              exit
         exit
    exit
ALA-B
    config router bgp
         group cluster1
             peer-as 100
              neighbor 1.1.1.1
              exit
         exit
    exit
ALA-C
    config router bgp
         group cluster1
              peer-as 100
              neighbor 1.1.1.1
              exit
         exit
    exit
ALA-D
    config router bgp
         group cluster1
             peer-as 100
              neighbor 1.1.1.1
              exit
         exit
    exit
```

Basic BGP Configuration

This section provides information to configure BGP and configuration examples of common configuration tasks. The minimal BGP parameters that need to be configured are:

- An autonomous system number for the router.
- A router ID Note that if a new or different router ID value is entered in the BGP context, then the new valued takes precedence and overwrites the router-level router ID.
- A BGP peer group.
- A BGP neighbor with which to peer.
- A BGP peer-AS that is associated with the above peer.

The BGP configuration commands have three primary configuration levels: **bgp** for global configurations, group **name** for BGP group configuration, and neighbor **ip-address** for BGP neighbor configuration. Within the different levels, many of the configuration commands are repeated. For the repeated commands, the command that is most specific to the neighboring router is in effect, that is, neighbor settings have precedence over group settings which have precedence over BGP global settings.

Following is a sample configuration that includes the above parameters. The other parameters shown below are optional:

```
echo "IP Configuration"
#-----
      autonomous-system 200
      confederation 300 members 200 400 500 600
      router-id 10.10.10.103
echo "BGP Configuration"
      hap
          graceful-restart
          exit
          cluster 0.0.0.100
          export "direct2bgp"
          router-id 10.0.0.12
          group "To_AS_10000"
              connect-retry 20
             hold-time 90
              keepalive 30
              local-preference 100
              remove-private
              peer-as 10000
              neighbor 10.0.0.8
                 description "To_Router B - EBGP Peer"
```

```
connect-retry 20
                   hold-time 90
                   keepalive 30
                   local-address 10.0.0.12
                  passive
                  preference 99
                  peer-as 10000
               exit
           exit
           group "To_AS_30000"
               connect-retry 20
               hold-time 90
               keepalive 30
               local-preference 100
               remove-private
               peer-as 30000
               neighbor 10.0.3.10
                  description "To_Router C - EBGP Peer"
                   connect-retry 20
                  hold-time 90
                  keepalive 30
                  peer-as 30000
               exit
           exit
           group "To_AS_40000"
               connect-retry 20
               hold-time 30
               keepalive 30
               local-preference 100
               peer-as 65206
               neighbor 10.0.0.15
                  description "To_Router E - Sub Confederation AS 65205"
                   connect-retry 20
                  hold-time 90
                   keepalive 30
                   local-address 10.0.0.12
                  peer-as 65205
               exit
           exit
       exit
           ______
A:ALA-48>config>router#
```

Common Configuration Tasks

This section provides a brief overview of the tasks that must be performed to configure BGP and provides the CLI commands. In order to enable BGP, one AS must be configured and at least one group must be configured which includes neighbor (system or IP address) and peering information (AS number).

Configure BGP hierarchically, the global level (applies to all peers), the group level (applies to all peers in peer-group), or the neighbor level (only applies to specified peer). By default, group members inherit the group's configuration parameters although a parameter can be modified on a per-member basis without affecting the group-level parameters.

Many of the hierarchical BGP commands can be used on different levels. The most specific value is used. That is, a BGP group-specific command takes precedence over a global BGP command. A neighbor-specific statement takes precedence over a global BGP or group-specific command.

All BGP instances must be explicitly created on each 7750 SR-Series. Once created, BGP is administratively enabled.

Configuration planning is essential to organize ASs and the SRs within the ASs, and determine the internal and external BGP peering.

To configure a basic autonomous system, perform the following tasks:

- 1. Prepare a plan detailing the autonomous sytem(s), the 7750 SR-Series belonging to each group, group names, and peering connections.
- 2. Associate each 7750 SR-Series with an autonomous system number.
- 3. Configure each 7750 SR-Series with a router ID.
- 4. Associate each 7750 SR-Series with a peer group name.
- 5. Specify the local IP address that will be used by the group or neighbor when communicating with BGP peers.
- 6. Specify neighbors.
- 7. Specify the autonomous system number associated with each neighbor.

Creating an Autonomous System

Before BGP can be configured, the autonomous system must be configured first. In BGP, routing reachability information is exchanged between autonomous systems (ASs). An AS is a group of networks that share routing information. The **autonomous-system** command associates an autonomous system number to the router being configured. A 7750 SR-Series router can only belong to one AS. The autonomous-system command is configured in the **config>router** context.

Use the following CLI syntax to associate a 7750 SR-Series to an autonomous system:

CLI Syntax: config>router# autonomous-system autonomous-system

The following example displays autonomous system configuration command usage:

Example: config>router# autonomous-system 100

The following example displays the autonomous system configuration:

Configuring a Router ID

In BGP, routing information is exchanged between autonomous systems. The BGP router ID, expressed like an IP address, uniquely identifies the router. It can be set to be the same as the loopback address.

Note that if a new or different router ID value is entered in the BGP context, then the new router ID value is used instead of the router ID configured on the router level, system interface level, or inherited from the MAC address. The router-level router ID value remains intact. A router ID can be derived by:

- Defining the value in the **config>router** *router-id* context.
- Defining the system interface in the config>router>interface ip-int-name context.
- Inheriting the last four bytes of the MAC address.
- The BGP protocol level. The router ID can be defined in the **config>router>bgp** *router-id* context and is only used within BGP.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is (re) initialized the new router ID is used. An interim period of time can occur when different protocols use different router IDs. To force the new router ID, issue the shutdown and no shutdown commands for each protocol that uses the router ID or restart the entire router. Use the following CLI syntax to configure the router ID:

```
CLI Syntax: config>router# router-id router-id
```

The following example displays router ID configuration command usage:

```
Example: config>router# router-id 10.10.10.104
```

The following example displays the router ID configuration:

BGP Components

Use the CLI syntax displayed below to configure the following BGP attributes:

- BGP Components on page 555
- Configuring Group Attributes on page 557
- Configuring Neighbor Attributes on page 558
- Configuring Route Reflection on page 559
- Configuring a Confederation on page 560

Configuring BGP

Once the BGP protocol instance is created, the no shutdown command is not required since BGP is administratively enabled upon creation. Minimally, to enable BGP on a router, you must associate an autonomous system number for the router, have a pre-configured router ID or system interface, create a peer group, neighbor, and associate a peer AS number. There are no default groups or neighbors. Each group and neighbor must be explicitly configured.

All parameters configured for BGP are applied to the group and are inherited by each peer, but a group parameter can be overridden on a specific basis. BGP command hierarchy consists of three levels:

- The global level
- The group level
- The neighbor level

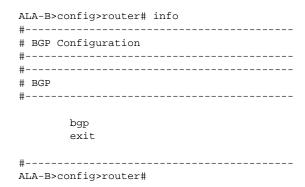

For example:

CLI Syntax: config>router# bgp (global level)
group (group level)
neighbor (neighbor level)

NOTE: Careful planning is essential to implement commands that can affect the behavior of global, group, and neighbor levels. Because the BGP commands are hierarchical, analyze the values that can disable features on a particular level.

Common Configuration Tasks

The following example displays the basic BGP configuration:

Configuring Group Attributes

A group is a collection of related BGP peers. The group name should be a descriptive name for the group. Follow your group, name, and ID naming conventions for consistency and to help when troubleshooting faults.

All parameters configured for a peer group are applied to the group and are inherited by each peer (neighbor), but a group parameter can be overridden on a specific neighbor-level basis.

The following example displays the BGP group configuration:

Configuring Neighbor Attributes

After you create a group name and assign options, add neighbors within the same autonomous system to create IBGP connections and/or neighbors in different autonomous systems to create EBGP peers. All parameters configured for the peer group level are applied to each neighbor, but a group parameter can be overridden on a specific neighbor basis.

The following example displays neighbors configured in group "headquarters1".

```
ALA-B>config>router>bgp# info

               exit
           exit
ALA-B>config>router>bgp#
```

Configuring Route Reflection

Route reflection can be implemented in autonomous systems with a large internal BGP mesh to reduce the number of IBGP sessions required. One or more routers can be selected to act as focal points for internal BGP sessions. Several BGP speaking routers can peer with a route reflector. A route reflector forms peer connections to other route reflectors. A router assumes the role as a route reflector by configuring the cluster cluster-id command. No other command is required unless you want to disable reflection to specific peers.

If you configure the cluster command at the global level, then all subordinate groups and neighbors are members of the cluster. The route reflector cluster ID is expressed in dotted decimal notation. The ID should be a significant topology-specific value. No other command is required unless you want to disable reflection to specific peers.

If a route reflector client is fully meshed, the disable-client-reflect command can be enabled to stop the route reflector from reflecting redundant route updates to a client.

The following example displays a route reflection configuration:

```
ALA-B>config>router>bgp# info
_____
          cluster 0.0.0.100
          group "Santa Clara"
             local-address 10.0.0.103
             neighbor 10.0.0.91
                peer-as 100
             exit
             neighbor 10.0.0.92
                peer-as 100
             exit
             neighbor 10.0.0.93
                disable-client-reflect
                peer-as 100
             exit
          exit
ALA-B>config>router>bgp#
```

Configuring a Confederation

Reducing a complicated IBGP mesh can be accomplished by dividing a large autonomous system into smaller autonomous systems. The smaller ASs can be grouped into a confederation. A confederation looks like a single AS and is fully meshed within itself. Each confederation is identified by its own (confederation) AS number.

There are minimal connections to other autonomous systems in the same confederation. Routing information is exchanged within the confederations on an IBGP-peer basis. Routing information parameters such as next hop, MED, and local preference is preserved.

To configure a BGP confederation, you must specify a confederation identifier, an AS number expressed as a decimal integer. The collection of autonomous systems appears as a single autonomous system with the confederation number acting as the "all-inclusive" autonomous system number. Up to 15 members (ASs) can be added to a confederation.

NOTE: The confederation command is configured in the **config>router** context.

Use the following CLI syntax to configure a confederation:

CLI Syntax: config>router# confederation *confed-as-num* members *member-as-num*

The following example displays a confederation configuration command usage:

Example: config>router># confederation 1000 members 100 200 300

The following example displays the confederation configuration:

BGP Configuration Management Tasks

This section discusses the following BGP configuration management tasks:

- Modifying an AS Number on page 561
- Modifying a Confederation Number on page 562
- Modifying the BGP Router ID on page 562
- Modifying the Router-Level Router ID on page 563
- Deleting a Neighbor on page 564
- Deleting Groups on page 565
- Editing BGP Parameters on page 566

Modifying an AS Number

You can modify an AS number on a 7750 SR-Series but the new AS number will not be used until the BGP instance is restarted either by administratively disabling or enabling the BGP instance or by rebooting the system with the new configuration.

Since the AS number is defined in the **config>router** context, not in the BGP configuration context, the BGP instance is not aware of the change. Re-examine the plan detailing the autonomous sytem(s), the SRs belonging to each group, group names, and peering connections. Changing an AS number on a 7750 SR-Series could cause configuration inconsistencies if associated **peer-as** values are not also modified as required. At the group and neighbor levels, BGP will re-establish the peer relationships with all peers in the group with the new AS number.

Use the following CLI syntax to change an autonomous system number:

config>router>bgp>group# peer-as 400

config>router>bqp>qroup# exit

Modifying a Confederation Number

Modifying a confederation number will cause BGP to restart automatically. Changes immediately take effect.

Modifying the BGP Router ID

Changing the router ID number in the BGP context causes the new value to overwrite the router ID configured on the router level, system interface level, or the value inherited from the MAC address. Changing the router ID on a router could cause configuration inconsistencies if associated values are not also modified.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is (re) initialized the new router ID is used. An interim period of time can occur when different protocols use different router IDs. To force the new router ID, issue the shutdown and no shutdown commands for each protocol that uses the router ID or restart the entire router.

This example displays the BGP configuration with the BGP router ID specified:

```
ALA-B>config>router>bgp# info detail

no shutdown
no description
no always-compare-med
ibgp-multipath load-balance
. . .
router-id 10.0.0.123

ALA-B>config>router>bgp#
```

Modifying the Router-Level Router ID

Changing the router ID number in the <code>config>router</code> context causes the new value to overwrite the router ID configured on the protocol level, system interface level, or the value inherited from the MAC address. Changing the router ID on a router could cause configuration inconsistencies if associated values are not also modified.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is (re) initialized the new router ID is used. An interim period of time can occur when different protocols use different router IDs. To force the new router ID, issue the shutdown and no shutdown commands for each protocol that uses the router ID or restart the entire router.

Use the following CLI syntax to change a router ID:

```
CLI Syntax: config>router# router-id router-id
```

```
Example: config>router# router-id 10.10.10.104 config>router# no shutdown config>router>bgp# shutdown config>router>bgp# no shutdown
```

The following example displays the router ID configuration:

```
ALA-A>config>router# info
#------
# IP Configuration
#------
interface "system"
    address 10.10.10.104/32
exit
interface "to-103"
    address 10.0.0.104/24
    port 1/1/1
exit
autonomous-system 100
router-id 10.10.10.104
```

Deleting a Neighbor

In order to delete a neighbor, you must shut down the neighbor before issuing the no neighbor ip-addr command.

Use the following CLI syntax to delete a neighbor:

```
CLI Syntax: config>router# bgp
group name
no neighbor ip-address
shutdown
no peer-as asn
shutdown

Example: config>router# bgp
config>router* bgp# group headquarters1
config>router>bgp# group# neighbor 10.0.0.103
config>router>bgp>group>neighbor# shutdown
config>router>bgp>group>neighbor# exit
config>router>bgp>group# no neighbor 10.0.0.103
```

The following example displays the "headquarters1" configuration with the neighbor 10.0.0.103 removed.

Deleting Groups

In order to delete a group, the neighbor configurations must be shut down first. After each neighbor is shut down, you must shut down the group before issuing the no group name command.

Use the following CLI syntax to shut down a peer and neighbor and then delete a group:

```
CLI Syntax: config>router# bgp
no group name
shutdown
no neighbor ip-address
shutdown
shutdown
```

If you try to delete the group without shutting down the peer-group, the following message appears:

```
ALA-B>config>router>bgp# no group headquarters1
MINOR: CLI BGP Peer Group should be shutdown before deleted. BGP Peer
Group not deleted.
```

Editing BGP Parameters

You can change existing BGP parameters in the CLI. The changes are applied immediately.

Example: config>router# bgp

Refer to BGP Components on page 555 for a complete list of BGP parameters.

bgp

Syntax [no] bgp

Context config>router

Description This command creates the BGP protocol instance and BGP configuration context. BGP is administratively

enabled upon creation.

The **no** form of the command deletes the BGP protocol instance and removes all configuration parameters for the BGP instance. BGP must be **shutdown** before deleting the BGP instance. An error occurs if BGP is

not shutdown first.

advertise-inactive

Syntax [no] advertise-inactive

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables the advertising of inactive BGP routes to other BGP peers. By default, BGP only

advertises BGP routes to other BGP peers if a given BGP route is chosen by the route table manager as the most preferred route within the system and is active in the forwarding plane. This command allows system administrators to advertise a BGP route even though it is not the most preferred route within the system for a

given destination.

The **no** form of the command disables the advertising of inactive BGP routers to other BGP peers.

Default no advertise-inactive

advertise-label

Syntax advertise-label [ipv4 [include-ldp-prefix]] [ipv6]

no advertise-label

Context config>router>bgp>group>neighbor

Description This command configures the IPv4 transport peers to exchange IPv6 prefixes using 6PE, LDP FEC prefixes

as RFC3107 labeled IPv4, as well as RFC 3107-labeled IPv4 routes.

If ipv4 is enabled all IPv4 routes advertised to the remote BGP peer will be sent with an RFC 3107-formatted label for the destination route. If **include-ldp-fec-prefix** option is also enabled, all activated /32

LDP FEC prefixes will be sent the to remote BGP peer with an RFC 3107 formatted label.

If ipv6 is enabled all IPv6 routes advertised to the remote BGP peer will be sent using the 6PE encapsulation.

The **no** form of the command disables any or all configured options.

The command must include one or more of the options above.

Default no advertise-label

Parameters ipv4 — Specifies the advertisement label address family for core IPv4 routes. This keyword can be specified only for an IPv4 peer.

include-ldp-prefix — Specifies the inclusion of LDP FEC prefixes in the advertisement of core IPv4 routes as EFC 3107 labeled routes to the peer.

ipv6 — Specifies the advertisement label address family to support the 6PE feature. This keyword can be specified only for an IPv6 peer.

aggregator-id-zero

Syntax [no] aggregator-id-zero

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command is used to set the router ID in the BGP aggregator path attribute to zero when BGP aggregates

routes. This prevents different routers within an AS from creating aggregate routes that contain different AS

paths.

When BGP is aggregating routes, it adds the aggregator path attribute to the BGP update messages. By default, BGP adds the AS number and router ID to the aggregator path attribute.

When this command is enabled, BGP adds the router ID to the aggregator path attribute. This command is used at the group level to revert to the value defined under the global level, while this command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of the command used at the global level reverts to default where BGP adds the AS number and router ID to the aggregator path attribute.

The **no** form of the command used at the group level reverts to the value defined at the global level. The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no aggregator-id-zero — BGP adds the AS number and router ID to the aggregator path attribute.

always-compare-med

Syntax always-compare-med {zero | infinity}

no always-compare-med

Context config>router>bgp

Description This command specifies how the Multi-Exit Discriminator (MED) path attribute is used in the BGP route

selection process. The MED attribute is always used in the route selection process regardless of the peer AS

that advertised the route. This parameter determines what MED value is inserted in the RIB-IN.

If this parameter is not configured, only the MEDs of routes that have the same peer ASs are compared.

The **no** form of the command removes the parameter from the configuration.

Default no always-compare-med — Only compare MEDs of routes that have the same peer AS.

Parameters zero — Specifies that for routes learned without a MED attribute that a zero (0) value is used in the MED

comparison. The routes with the lowest metric are the most preferred.

infinity — Specifies for routes learned without a MED attribute that a value of infinity (2^32-1) is used in

the MED comparison. This in effect makes these routes the least desirable.

as-path-ignore

Syntax as-path-ignore [ipv4] [vpn-ipv4] [ipv6] [vpn-ipv6] [mcast-ipv4] [mvpn-ipv4] [l2-vpn]

no as-path-ignore

Context config>router>bgp

Description This command determines whether the AS path is used to determine the best BGP route.

If this option is present, the AS paths of incoming routes are not used in the route selection process.

The **no** form of the command removes the parameter from the configuration.

Default no as-path-ignore

Parameters ipv4 — Specifies that the AS-path length will be ignored for all IPv4 routes.

vpn-ipv4 — Specifies that the lengthAS-path will be ignored for all IPv4 VPRN routes.

ipv6 — Specifies that the AS-path length will be ignored for all IPv6 routes.

vpn-ipv6 — Specifies that the AS-path length will be ignored for all IPv6 VPRN routes.

mcast-ipv4 — Specifies that the AS-path length will be ignored for all IPv4 multicast routes.

mvpn-ipv4 — Specifies that the AS-path length will be ignored for all mVPN IPv4 multicast routes.

12-vpn — The AS-path length will be ignored for all L2-VPN NLRIs.

auth-keychain

Syntax auth-keychain name

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures a TCP authentication keychain to use for the session. The keychain allows the

rollover of authentication keys during the lifetime of a session.

Default no auth-keychain

Parameters name — Specifies the name of the keychain, up to 32 characters, to use for the specified TCP session or ses-

sions.

authentication-key

Syntax authentication-key [authentication-key | hash-key] [hash | hash2]

no authentication-key

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the BGP authentication key.

Authentication is performed between neighboring routers before setting up the BGP session by verifying the

password. Authentication is performed using the MD-5 message based digest.

The authentication key can be any combination of ASCII characters up to 255 characters long.

The **no** form of the command reverts to the default value.

Default MD5 Authentication is disabled by default.

Parameters *authentication-key* — The authentication key. The key can be any combination of ASCII characters up to 255 characters in length (unencrypted). If spaces are used in the string, enclose the entire string in quo-

tation marks (" ").

hash-key — The hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks ("").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

hash — Specifies the key is entered in an encrypted form. If the **hash** parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** parameter specified.

hash2 — Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

bfd-enable

Syntax [no] bfd-enable

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables the use of bi-directional forwarding (BFD) to control the state of the associated

protocol interface. By enabling BFD on a given protocol interface, the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. The parameters used for the BFD

are set via the BFD command under the IP interface.

The **no** form of this command removes BFD from the associated IGP/BGP protocol adjacency.

Default no bfd-enable

cluster

Syntax cluster cluster-id

no cluster

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the cluster ID for a route reflector server.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives a route, first it must select the best path from all the paths received. If the route was received from a non-client peer, then the route reflector sends the route to all clients in the cluster. If the route came from a client peer, the route reflector sends the route to all non-client peers and to all client peers except the originator.

For redundancy, a cluster can have multiple route reflectors.

Confederations can also be used to remove the full IBGP mesh requirement within an AS.

The **no** form of the command deletes the cluster ID and effectively disables the Route Reflection for the given group.

Default no cluster — No cluster ID is defined.

Parameters cluster-id — The route reflector cluster ID is expressed in dot decimal notation.

Values Any 32 bit number in dot decimal notation. (0.0.0.1 - 255.255.255.255)

confederation

Syntax confederation confed-as-num members member-as-num

no confederation confed-as-num [members member-as-num]

Context config>router

Description This command creates confederation autonomous systems within an AS.

This technique is used to reduce the number of IBGP sessions required within an AS. Route reflection is the other technique that is commonly deployed to reduce the number of IBGP sessions.

The **no** form of the command deletes the specified member AS from the confederation.

When members are not specified in the **no** statement, the entire list is removed and confederations is

disabled.

When the last member of the list is removed, confederations is disabled.

Default no confederation — No confederations are defined.

Parameters confed-as-num — The confederation AS number expressed as a decimal integer.

Values 1 — 65535

members *member-as-num* — *The* AS number(s) of members that are part of the confederation expressed as a decimal integer. Configure up to 15 members per *confed-as-num*.

connect-retry

Syntax connect-retry seconds

no connect-retry

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the BGP connect retry timer value in seconds.

When this timer expires, BGP tries to reconnect to the configured peer. This configuration parameter can be set at three levels: global level (applies to all peers), peer-group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of the command used at the global level reverts to the default value.

The **no** form of the command used at the group level reverts to the value defined at the global level. The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 120 seconds

Parameters seconds — The BGP Connect Retry timer value in seconds expressed as a decimal integer.

Values 1 — 65535

damping

Syntax [no] damping

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables BGP route damping for learned routes which are defined within the route policy. Use

damping to reduce the number of update messages sent between BGP peers and reduce the load on peers without affecting the route convergence time for stable routes. Damping parameters are set via route policy

definition.

The **no** form of the command used at the global level reverts route damping.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

When damping is enabled and the route policy does not specify a damping profile, the default damping profile is used. This profile is always present and consists of the following parameters:

Half-life: 15 minutes
Max-suppress: 60 minutes
Suppress-threshold: 3000
Reuse-threshold: 750

Default no damping — Learned route damping is disabled.

description

Syntax description description-string

no description

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command creates a text description stored in the configuration file for a configuration context.

The **no** form of the command removes the description string from the context.

Default No description is associated with the configuration context.

Parameters string — The description character string. Allowed values are any string up to 80 characters long composed

of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the

entire string must be enclosed within double quotes.

disable-4byte-asn

Syntax [no] disable-4byte-asn

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command disables the use of 4-byte ASNs. It can be configured at all 3 level of the hierarchy so it can

be specified down to the per peer basis.

If this command is enabled 4-btye ASN support should not be negotiated with the associated remote peer(s).

The **no** form of the command resets the behavior to the default which is to enable the use of 4-byte ASN.

disable-client-reflect

Syntax [no] disable-client-reflect

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command disables the reflection of routes by the route reflector to the clients in a specific group or

neighbor.

This only disables the reflection of routes from other client peers. Routes learned from non-client peers are

still reflected to all clients.

The **no** form re-enables client reflection of routes.

Default no disable-client-reflect — Client routes are reflected to all client peers.

disable-communities

Syntax disable-communities [standard] [extended]

no disable-communities

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures BGP to disable sending communities.

Parameters standard — Specifies standard communities that existed before VPRNs or 2547.

extended — Specifies BGP communities used were expanded after the concept of 2547 was introduced, to

include handling the VRF target.

disable-fast-external-failover

Syntax [no] disable-fast-external-failover

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures BGP fast external failover.

enable-inter-as-vpn

Syntax [no] enable-inter-as-vpn

Context config>router>bgp

Description This command specifies whether VPNs can exchange routes across autonomous system boundaries,

providing model B connectivity

The **no** form of the command disallows ASBRs to advertise VPRN routes to their peers in other autonomous

systems.

Default no enable-inter-as-vpn

enable-peer-tracking

Syntax [no] enable-peer-tracking

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables BGP peer tracking. BGP peer tracking allows a BGP peer to be dropped immediately

if the route used to resolve the BGP peer address is removed from the IP routing table and there is no alternative available. The BGP peer will not wait for the holdtimer to expire; therefore, the BGP

reconvergance process is accelerated.

The **no** form of the command disables peer tracking.

Default no enable-peer-tracking

export

Syntax export *policy-name* [*policy-name...*]

no export [policy-name]

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command specifies the export route policy used to determine which routes are advertised to peers.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific level

is used.

When multiple policy names are specified, the policies are evaluated in the order they are specified. A maximum of five (5) policy names can be configured. The first policy that matches is applied.

When multiple export commands are issued, the last command entered overrides the previous command.

When no export policies are specified, BGP routes are advertised and non-BGP routes are not advertised by default.

The **no** form of the command removes the policy association with the BGP instance. To remove association of all policies, use the **no export** command without arguments.

Default no export — No export policy is specified. BGP routes are advertised and non-BGP routes are not

advertised.

Parameters policy-name — The route policy name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>pol-**

icy-options context.

family

Syntax family [ipv4] [vpn-ipv4] [ipv6] [mcast-ipv4] [l2-vpn] [mvpn-ipv4]

no family

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command specifies the address family or families to be supported over BGP peerings in the base router.

This command is additive so issuing the family command adds the specified address family to the list.

The no form of the command removes the specified address family from the associated BGP peerings. If an

address family is not specified, then reset the supported address family back to the default.

Default ipv4

Parameters ipv4 — Provisions support for IPv4 routing information.

vpn-ipv4 — Exchanges IPv4 VPN routing information.

ipv6 — Exchanges IPv6 routing information.

mcast-ipv4 — Exchanges multicast IPv4 routing information.

12-vpn — Exchanges Layer 2 VPN information.

mvpn-ipv4 — Exchanges Multicast VPN related information

route-target-list

Syntax route-target-list comm-id [comm-id ..[up to 15 max]]

no route-target-list [comm-id]

Context config>router>bgp

Description This command specifies the route target(s) to be accepted and advertised from/to route reflector clients. If

the **route-target-list** is a non-null list, only routes with one or more of the given route targets are accepted or

advertised to route reflector clients.

This command is only applicable if the router is a route-reflector server. This parameter has no affect on

non-route-reflector clients.

If the route-target-list is assigned at the global level, then the list applies to all route-reflector clients

connected to the system.

The **no** form of the command with a specified route target community, removes the specified community from the **route-target-list**. The **no** form of the command entered *without* a route target community removes

all communities from the list.

Default no route-target-list

Parameters comm-id — Specifies the route target community in the form <0..65535>:<0..65535>

vpn-apply-export

Syntax [no] vpn-apply-export

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command causes the base instance BGP export route policies to be applied to VPN-IPv4 routes.

The **no** form of the command disables the application of the base instance BGP route policies to VPN-IPv4

routes.

Default no vpn-apply-export

vpn-apply-import

Syntax [no] vpn-apply-import

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command causes the base instance BGP import route policies to be applied to VPN-IPv4 routes.

The **no** form of the command disables the application of the base instance BGP import route policies to

VPN-IPv4 routes.

Default no vpn-apply-import

graceful-restart

Syntax [no] graceful-restart

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables graceful-restart for BGP. When the control plane of a GR-capable router fails, the

neighboring routers (GR helpers) temporarily preserve neighbor information, so packets continue to be forwarded through the failed GR router using the last known routes. The helper state remains until the peer

completes its restart or exits if the GR timer value is exceeded.

The **no** form of the command disables graceful restart and removes all graceful restart configurations in the

BGP instance.

Default no graceful-restart

stale-routes-time

Syntax stale-routes-time time

no stale-routes-time

Context config>router>bgp>graceful-restart

config>router>bgp>group>graceful-restart

config>router>bgp>group>neighbor>graceful-restart

Description This command configures the maximum amount of time in seconds that stale routes should be maintained

after a graceful restart is initiated.

The **no** form of the command resets the stale routes time back to the default of 360 seconds.

Default no restart time

Parameters time — Specify the amount of time that stale routes should be maintained after a graceful restart is initiated.

Values 1 — 3600 seconds

group

Syntax [no] group name

Context config>router>bgp

Description This command creates a context to configure a BGP peer group.

The \mathbf{no} form of the command deletes the specified peer group and all configurations associated with the peer

group. The group must be **shutdown** before it can be deleted.

Default No peer groups are defined.

Parameters name — The peer group name. Allowed values are any string up to 32 characters long composed of print-

able, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string

must be enclosed within double quotes.

hold-time

Syntax hold-time seconds [strict]

no hold-time

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the BGP hold time, expressed in seconds.

The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

Even though the 7750 SR OS implementation allows setting the **keepalive** time separately, the configured **keepalive** timer is overridden by the **hold-time** value under the following circumstances:

- 1. If the specified hold-time is less than the configured **keepalive** time, then the operational **keepalive** time is set to a third of the **hold-time**; the configured **keepalive** time is not changed.
- 2. If the **hold-time** is set to zero, then the operational value of the **keepalive** time is set to zero; the configured **keepalive** time is not changed. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of the command used at the global level reverts to the default value.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 90 seconds

Parameters seconds — The hold-time, in seconds, expressed as a decimal integer. A value of 0 indicates the connection to the peer is up permanently.

Values 0, 3 — 65535

strict — When this parameter is specified, the advertised BGP hold-time from the far-end BGP peer must be greater than or equal to the specified value.

ibgp-multipath

Syntax [no] ibgp-multipath

Context config>router>bgp

Description This command enables IBGP multipath load balancing when adding BGP routes to the route table if the

route resolving the BGP nexthop offers multiple nexthops.

The **no** form of the command disables the IBGP multipath load balancing feature.

Default no ibgp-multipath

igp-shortcut

Syntax igp-shortcut [ldp | rsvp-te | mpls] [disallow-igp]

no igp-shortcut

Context config>router>bgp

Description This command enables the use of LDP tunnels, RSVP tunnels, or both, to resolve paths to BGP next-hops.

The **ldp** option instructs BGP to search for an LDP LSP with a FEC prefix corresponding to the /32 address of the BGP next-hop. This deprecates the existing ldp-shortcut command under BGP. Support for the older

command will be provided over a number of releases to allow old config files to execute.

The result to entire instructs RCP to search for the best matrix PSVP I SP to the /32 address.

The **rsvp-te** option instructs BGP to search for the best metric RSVP LSP to the /32 address of the BGP next-hop. This address can correspond to the system interface or to another loopback used by the BGP instance on the remote node as its router-id. The LSP metric is provided by MPLS in the tunnel table.

The **mpls** option instructs BGP to first attempt to resolve the BGP next-hop to an RSVP LSP. If no RSVP LSP exists or if the existing ones are down, BGP will automatically search for the LDP LSP with a FEC prefix corresponding to the same /32 prefix in the tunnel table and will resolve the BGP next-hop to it.

The **disallow-igp** option also deprecates the existing one under BGP. It continues to work transparently regardless of which type of LSP shortcut, RSVP or LDP, is being used by BGP at any given time. When this option is enabled and if an LSP shortcut of the configured type is not available, the IGP next-hop route will not be used for the BGP next-hop resolution.

Default no igp-shortcut

Parameters Idp — Enables the use of LDP LSPs for BGP next-hop resolution by BGP.

rsvp-te — Enables the use of RSVP LSPs for BGP next-hop resolution by BGP.

mpls — Enables the use of both RSVP and LDP LSPs for BGP next-hop resolution by BGP. RSVP LSPs are preferred.

disallow-igp — Prevents BGP next-hop resolution to a regular IGP next-hop if no LSP shortcut was found.

import

Syntax import policy-name [policy-name...]

no import [policy-name]

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command specifies the import route policy to be used to determine which routes are accepted from

peers. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific level

is used.

When multiple policy names are specified, the policies are evaluated in the order they are specified. A

maximum of five (5) policy names can be specified. The first policy that matches is applied.

When multiple import commands are issued, the last command entered will override the previous

command.

When an import policy is not specified, BGP routes are accepted by default.

The no form of the command removes the policy association with the BGP instance. To remove association

of all policies, use **no import** without arguments.

Default no import — No import policy specified (BGP routes are accepted).

Parameters policy-name — The route policy name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>pol-**

icy-options context.

keepalive

Syntax keepalive seconds

no keepalive

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the BGP keepalive timer. A keepalive message is sent every time this timer

expires.

The **keepalive** parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **keepalive** value is generally one-third of the **hold-time** interval. Even though the 7750 SR OS implementation allows the **keepalive** value and the **hold-time** interval to be independently set, under the

following circumstances, the configured **keepalive** value is overridden by the **hold-time** value:

- 1. If the specified **keepalive** value is greater than the configured **hold-time**, then the specified value is ignored, and the **keepalive** is set to one third of the current **hold-time** value.
- 2. If the specified **hold-time** interval is less than the configured **keepalive** value, then the **keepalive** value is reset to one third of the specified **hold-time** interval.
- 3. If the **hold-time** interval is set to zero, then the configured value of the **keepalive** value is ignored. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The no form of the command used at the global level reverts to the default value

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 30 seconds

Parameters seconds — The keepalive timer in seconds expressed as a decimal integer.

Values 0 — 21845

local-address

Syntax local-address ip-address

no local-address

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description Configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, 7750 SR OS uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of the command removes the configured local-address for BGP.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no local-address - The router ID is used when communicating with IBGP peers and the interface address is

used for directly connected EBGP peers.

ip-address — The local address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

local-as

Syntax local-as as-number [private]

no local-as

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command co

This command configures a BGP virtual autonomous system (AS) number.

In addition to the AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number is configured. The virtual AS number is added to the as-path message before the router's AS number makes the virtual AS the second AS in the as-path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate as-number per EBGP session.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of the command used at the global level will remove any virtual AS number configured. The **no** form of the command used at the group level reverts to the value defined at the global level. The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no local-as

Parameters as-number — The virtual autonomous system number expressed as a decimal integer.

Values 1 — 65535

private — Specifies the local-as is hidden in paths learned from the peering.

local-preference

Syntax local-preference local-preference

no local-preference

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables setting the BGP local-preference attribute in incoming routes if not specified and

configures the default value for the attribute.

This value is used if the BGP route arrives from a BGP peer without the local-preference integer set.

The specified value can be overridden by any value set via a route policy. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or

neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of the command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-

preference value of 100.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no local-preference — Does not override the local-preference value set in arriving routes and analyze routes

without local preference with value of 100.

Parameters local-preference — The local preference value to be used as the override value expressed as a decimal inte-

ger.

Values 0 — 4294967295

loop-detect

Syntax | loop-detect {drop-peer | discard-route | ignore-loop | off}

no loop-detect

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures how the BGP peer session handles loop detection in the AS path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

Note that dynamic configuration changes of loop-detect are not recognized.

The **no** form of the command used at the global level reverts to default, which is **loop-detect ignore-loop**.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default loop-detect ignore-loop

Parameters drop-peer — Sends a notification to the remote peer and drops the session.

discard-route — Discards routes received from a peer with the same AS number as the router itself. This option prevents routes looped back to the router from being added to the routing information base and consuming memory. When this option is changed, the change will not be active for an established peer until the connection is re-established for the peer.

ignore-loop — Ignores routes with loops in the AS path but maintains peering.

off — Disables loop detection.

med-out

Syntax med-out {number | igp-cost}

no med-out

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables advertising the Multi-Exit Discriminator (MED) and assigns the value used for the

path attribute for the MED advertised to BGP peers if the MED is not already set.

The specified value can be overridden by any value set via a route policy.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of the command used at the global level reverts to default where the MED is not advertised.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no med-out

Parameters number — The MED path attribute value expressed as a decimal integer.

Values 0 — 4294967295

igp-cost — The MED is set to the IGP cost of the given IP prefix.

min-as-origination

Syntax min-as-origination seconds

no min-as-origination

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the minimum interval, in seconds, at which a path attribute, originated by the local

router, can be advertised to a peer.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of the command used at the global level reverts to default.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 15 seconds

Parameters seconds — The minimum path attribute advertising interval in seconds expressed as a decimal integer.

Values 2 — 255

min-route-advertisement

Syntax min-route-advertisement seconds

no min-route-advertisement

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the minimum interval, in seconds, at which a prefix can be advertised to a peer.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of the command used at the global level reverts to default.

The **no** form of the command used at the group level reverts to the value defined at the global level. The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 30 seconds

Parameters seconds — The minimum route advertising interval, in seconds, expressed as a decimal integer.

Values 1—255

multihop

Syntax multihop ttl-value

no multihop

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the time to live (TTL) value entered in the IP header of packets sent to an EBGP

peer multiple hops away.

The **no** form of the command is used to convey to the BGP instance that the EBGP peers are directly

connected.

The **no** form of the command used at the global level reverts to default.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 1 — EBGP peers are directly connected.

64 — IBGP

Parameters *ttl-value* — The TTL value expressed as a decimal integer.

Values 1 — 255

multipath

Syntax multipath integer

no multipath

Context config>router>bgp

Description This command enables BGP multipath.

When multipath is enabled BGP load shares traffic across multiple links. Multipath can be configured to load share traffic across a maximum of 16 routes. If the equal cost routes available are more than the

configured value, then routes with the lowest next-hop IP address value are chosen.

This configuration parameter is set at the global level (applies to all peers).

Multipath is effectively disabled if the value is set to one. When multipath is disabled, and multiple equal

cost routes are available, the route with the lowest next-hop IP address will be used.

The **no** form of the command used at the global level reverts to default where **multipath** is disabled.

Default no multipath

Parameters integer — The number of equal cost routes to use for multipath routing. If more equal cost routes exist than

the configured value, routes with the lowest next-hop value are chosen. Setting this value to 1 disables

multipath.

Values 1 — 16

outbound-route-filtering

Syntax [no] outbound-route-filtering

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command opens the configuration tree for sending or accepting BGP filter lists from peers (outbound

route filtering).

Default no outbound-route-filtering

extended-community

Syntax [no] extended-community

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description The extended-community command opens the configuration tree for sending or accepting extended-

community based BGP filters.

In order for the no version of the command to work, all sub-commands (send-orf, accept-orf) must be

removed first.

Default Community filtering is not enabled by default.

accept-orf

Syntax [no] accept-orf

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command instructs the router to negotiate the receive capability in the BGP ORF negotiation with a

peer, and to accept filters that the peer wishes to send.

The no form of the command causes the router to remove the accept capability in the BGP ORF negotiation

with a peer, and to clear any existing ORF filters that are currently in place.

Default Accepting ORFs is not enabled by default.

send-orf

Syntax send-orf [comm-id...(up to 32 max)]

no send-orf [comm-id]

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command instructs the router to negotiate the send capability in the BGP outbound route filtering

(ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as

an inbound filter on the BGP session to its peer as an ORF Action ADD.

The no form of this command causes the router to remove the send capability in the BGP ORF negotiation

with a peer.

The no form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS

path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameter(s) are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameter(s) specified contain no

route targets, then the router will not send an ORF.

Default no send-orf — Sending ORF is not enabled by default.

Parameters comm-id — Any community policy which consists exclusively of route target extended communities. If it is

not specified, then the ORF policy is automatically generated from configured route target lists,

accepted client route target ORFs and locally configured route targets.

neighbor

Syntax [no] neighbor ip-address

Context config>router>bgp>group

Description This command creates a BGP peer/neighbor instance within the context of the BGP group.

This command can be issued repeatedly to create multiple peers and their associated configuration.

The **no** form of the command is used to remove the specified neighbor and the entire configuration associated with the neighbor. The neighbor must be administratively **shutdown** before attempting to delete it. If the neighbor is not shutdown, the command will not result in any action except a warning message on

the console indicating that neighbor is still administratively up.

Default No neighbors are defined.

Parameters *ip-address* — The IP address of the BGP peer router in dotted decimal notation.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H

d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses

next-hop-self

Syntax [no] next-hop-self {[ipv4] [vpn-ipv4] [ipv6] [mcast-ipv4] [l2-vpn]} [multihoming primary-anycast

secondary-anycast

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the group or neighbor to always set the NEXTHOP path attribute to its own

physical interface when advertising to a peer.

This is primarily used to avoid third-party route advertisements when connected to a multi-access network.

In addition, this command can be used to enable and configure the multi-homing resiliency mechanism

replacing the usual BGP nexthop with a configured anycast address.

The no form of the command used at the group level allows third-party route advertisements in a multi-

access network.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no next-hop-self — Third-party route advertisements are allowed.

Parameters ipv4 — Provisions support for IPv4 routing information.

vpn-ipv4 — Exchanges IPv4 VPN routing information.

ipv6 — Exchanges IPv6 routing information.

mcast-ipv4 — Exchanges multicast IPv4 routing information.

12-vpn — Exchanges Layer 2 VPN information.

primary-anycast — Specifies the anycast address that the local node will use to replace the BGP nexthop address in route updates associated peers.

secondary-address — Specifies the anycast address that the local node is to track.

passive

Syntax [no] passive

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description Enables/disables passive mode for the BGP group or neighbor.

When in passive mode, BGP will not attempt to actively connect to the configured BGP peers but responds

only when it receives a connect open request from the peer.

The **no** form of the command used at the group level disables passive mode where BGP actively attempts to connect to its peers.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no passive — BGP will actively try to connect to all the configured peers.

peer-as

Syntax peer-as as-number

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the autonomous system number for the remote peer. The peer AS number must be

configured for each configured peer.

For EBGP peers, the peer AS number configured must be different from the autonomous system number configured for this router under the global level since the peer will be in a different autonomous system than

this router

For IBGP peers, the peer AS number must be the same as the autonomous system number of this router

configured under the global level.

This is required command for each configured peer. This may be configured under the group level for all

neighbors in a particular group.

Default No AS numbers are defined.

Parameters as-number — The autonomous system number expressed as a decimal integer.

Values 1 — 4294967295

path-mtu-discovery

Syntax [no] path-mtu-discovery

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command enables path MTU discovery for the associated TCP connections. In doing so, the MTU for

the associated TCP session will be initially set to the egress interface MTU. The DF bit will also be set so that if a router along the path of the TCP connection cannot handle a packet of a particular size without fragmenting, it will send back and ICMP message to set the path MTU for the given session to a lower value

that can be forwarded without fragmenting.

The **no** form of the command disables path MTU discovery.

Default no path-mtu-discovery

preference

Syntax [no] preference preference

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the route preference for routes learned from the configured peer(s).

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The lower the preference the higher the chance of the route being the active route. 7750 SR OS assigns BGP routes highest default preference compared to routes that are direct, static or learned via MPLS or OSPF.

The **no** form of the command used at the global level reverts to default value.

The **no** form of the command used at the group level reverts to the value defined at the global level.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default 170

Parameters preference — The route preference expressed as a decimal integer.

Values 1 — 255

rapid-update

Syntax rapid-update {[I2-vpn] [mvpn-ipv4]}

no rapid-update { [I2-vpn] [mvpn-ipv4]}

Context config>router>bgp

Description This command enables and disables BGP rapid update for specified address-families. When no parameter is

given for the no rapid-update statement, rapid update is disabled for all address-families.

Default no rapid-update

rapid-withdrawal

Syntax [no] rapid-withdrawal

Context config>router>bgp

Description This command disables the delay (Minimum Route Advertisement) on sending BGP withdrawals. Normal

route withdrawals may be delayed up to the minimum route advertisement to allow for efficient packing of

BGP updates.

The no form of the command removes this command from the configuration and returns withdrawal

processing to the normal behavior.

Default no rapid-withdrawal

prefix-limit

Syntax prefix-limit | limit | log-only | [threshold percent]

no prefix-limit

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures the maximum number of routes BGP can learn from a peer.

When the number of routes reaches 90% of this limit, an SNMP trap is sent. When the limit is exceeded, the

BGP peering is dropped and disabled.

The **no** form of the command removes the **prefix-limit**.

Parameters log-only — Enables the warning message to be sent at the specified threshold percentage, and also when the

limit is exceeded. However, the BGP peering is not dropped.

percent — The threshold value (as a percentage) that triggers a warning message to be sent.

Default no prefix-limit

Parameters *limit* — The number of routes that can be learned from a peer expressed as a decimal integer.

Values 1 — 4294967295

remove-private

Syntax [no] remove-private {limited}

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command allows private AS numbers to be removed from the AS path before advertising them to BGP

peers.

When the **remove-private** parameter is set at the global level, it applies to all peers regardless of group or neighbor configuration. When the parameter is set at the group level, it applies to all peers in the group

regardless of the neighbor configuration.

7750 SR OS software recognizes the set of AS numbers that are defined by IANA as private. These are AS

numbers in the range 64512 through 65535, inclusive.

The **no** form of the command used at the global level reverts to default value. The **no** form of the command used at the group level reverts to the value defined at the global level. The **no** form of the command used at

the neighbor level reverts to the value defined at the group level.

Default no remove-private — Private AS numbers will be included in the AS path attribute.

limited — This optional keyword removes private ASNs up to the first public ASN encountered. It then stops removing private ASNs.

router-id

Syntax router-id ip-address

no router-id

Context config>router>bgp

Description This command specifies the router ID to be used with this BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new

router ID. The router ID must be set to a valid host address.

Default No router-id is configured for BGP by default. The system interface IP address is used.

Parameters ip-address — The router ID expressed in dotted decimal notation. Allowed value is a valid routable IP

address on the router, either an interface or system IP address. It is highly recommended that this

address be the system IP address.

shutdown

Syntax [no] shutdown

Context config>router>bgp

config>router>bgp>group

config>router>bgp>group>neighbor

Description This command administratively disables an entity. When disabled, an entity does not change, reset, or

remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within.

Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the

shutdown and **no shutdown** states are always indicated in system generated configuration files.

Default administrative states for services and service entities are described in Special Cases.

The **no** form of the command places an entity in an administratively enabled state.

Special Cases BGP Global — The BGP protocol is created in the **no shutdown** state.

BGP Group — BGP groups are created in the **no shutdown** state.

BGP Neighbor — BGP neighbors/peers are created in the **no shutdown** state.

ttl-security

Syntax ttl-security min-ttl-value

no ttl-security

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description This command configures TTL security parameters for incoming packets. When the feature is enabled,

BGP/LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or

equal to the minimum TTL value configured for that peer.

The **no** form of the command disables TTL security.

Parameters *min-ttl-value* — Specify the minimum TTL value for an incoming packet.

Values 1 — 255

Default 1

type

Syntax [no] type {internal | external}

Context config>router>bgp>group

config>router>bgp>group>neighbor

Description This command designates the BGP peer as type internal or external.

The type of internal indicates the peer is an IBGP peer while the type of external indicates that the peer is an

EBGP peer.

By default, 7750 SR OS derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then

the peer is considered external.

The **no** form of the command used at the group level reverts to the default value.

The **no** form of the command used at the neighbor level reverts to the value defined at the group level.

Default no type — Type of neighbor is derived on the local AS specified.

Parameters internal — Configures the peer as internal.

external — Configures the peer as external.

Other BGP-Related Commands

autonomous-system

Syntax autonomous-system autonomous-system

no autonomous-system

Context config>router

Description This command configures the autonomous system (AS) number for the router. A router can only belong to

one AS. An AS number is a globally unique number with an AS. This number is used to exchange exterior

routing information with neighboring ASs and as an identifier of the AS itself.

If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted either by administratively disabling/enabling (**shutdown/no shutdown**) the

BGP instance or rebooting the system with the new configuration.

Default No autonomous system number is defined.

Parameters as-number — The autonomous system number expressed as a decimal integer.

Values 1 — 4294967295

mh-primary-interface

Syntax mh-primary-interface interface-name

no mh-primary-interface

Context config>router

Description This command creates a loopback interface for the use in multihoming resilency. Once active this interface

can be used to advertise reachability information to the rest of the network using the primary address which

is backed up by the secondary

This reachability for this address is advertised via IGPs and LDP protocols to allow the resolution of BGP

routes advertised with this address.

The no form of the command disables this setting.

Default no mh-primary-interface

mh-secondary-interface

Syntax mh-secondary-interface interface-name

no mh-secondary-interface

Context config>router

Description This command creates a loopback interface for the use in multihoming resilency. This address is considered

the secondary multihoming address and is only used to resolve routes advertised by the primary router in the event that router becomes unavailable. For this purpose, the Reachability for this address is advertised via IGPs and LDP protocols to allow the resolution of BGP routes advertised with this address by the primary

multihoming router.

The no form of the command disables this setting.

Default no mh-secondary-interface

address

Syntax address {ip-address/mask | ip-address netmask}

no address

Context config>router>mh-primary-interface

config>router>mh-secondary-interface

Description This command assigns an IP address, IP subnet, and broadcast address format to an IP interface. Only one IP address can be associated with an IP interface.

An IP address must be assigned to each IP interface for the interface to be active. An IP address and a mask combine to create a local IP prefix. The defined IP prefix must be unique within the context of the routing instance. It cannot overlap with other existing IP prefixes defined as local subnets on other IP interfaces in the same routing context within the router.

The local subnet that the address command defines must not be part of the services address space within the routing context by use of the config router service-prefix command. Once a portion of the address space is allocated as a service prefix, that portion is not available to IP interfaces for network core connectivity.

The IP address for the interface can be entered in either CIDR (Classless Inter-Domain Routing) or traditional dotted decimal notation. Show commands display CIDR notation and are stored in configuration files

By default, no IP address or subnet association exists on an IP interface until it is explicitly created.

The no form of the command removes the IP address assignment from the IP interface. Interface specific configurations for IGP protocols like OSPF are also removed. The no form of this command can only be performed when the IP interface is administratively shut down. Shutting down the IP interface will operationally stop any protocol interfaces or MPLS LSPs that explicitly reference that IP address. When a new IP address is defined, the IP interface can be administratively enabled (no

shutdown), which reinitializes the protocol interfaces and MPLS LSPs associated with that IP interface.

If a new address is entered while another address is still active, the new address will be rejected.

Default no address

Parameters

ip-address — The IP address of the IP interface. The ip-addr portion of the address command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

- /— The forward slash is a parameter delimiter that separates the ip-addr portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the ipaddr, the "/" and the mask-length parameter. If a forward slash does not ediately follow the ipaddr, a dotted decimal mask must follow the prefix.
- mask-length The subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the ip-addr from the masklength parameter. The mask length parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1—32. Note that a mask length of 32 is reserved for system IP addresses.

Values 1—3

mask — The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the ip-addr from a traditional dotted decimal mask. The mask parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Note that a mask of 255.255.255.255 is reserved for system IP addresses.

net-mask — he subnet mask in dotted decimal notation.

Values 0.0.0.0 — 223.255.255.255 (network bits all 1 and host bits all 0)

description

Syntax description description-string

no description

Context config>router>mh-primary-interface

config>router>mh-secondary-interface

Description This command creates a text description stored in the configuration file for a configuration context.

The no form of the command removes the description string from the context.

Default no description

Parameters description-string — The description character string. Allowed values are any string up to 80 characters long

composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces,

etc.), the entire string must be enclosed within double quotes.

shutdown

Syntax shutdown

no shutdown

Context config>router>mh-primary-interface

config>router>mh-secondary-interface

Description The shutdown command administratively disables an entity. The operational state of the entity is disabled as

well as the operational state of any entities contained within. Many objects must be shut down before they

may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file,

shutdown and no shutdown are always indicated in system generated configuration files.

The no form of the command puts an entity into the administratively enabled state.

Default no shutdown

hold-time

Syntax hold-time holdover-time

no hold-time

Context config>router>mh-secondary-interface

Description The optional hold-time parameter is only applicable for the secondary context and specifies how long label

information learned about the secondary anycast address should be kept after that peer is declared down. This timer should be set to a value large enough for the remainder of the network to detect the failure and

complete the reconvergence process.

The no form of the command resets the hold-time back to the default value.

Default no hold-time

Parameters holdover-time — (seconds) specifies the number of seconds the router should hold label information learned

from the alternate router in it's secondary label table. This is to allow the reset of the network to reconverge after a router failure before the anycast based label assignments are flushed from the

forwarding plane.

Values 0—65535

Default 90

Other BGP-Related Commands

shutdown

Syntax router-id ip-address

[no] router-id

Context config>router

Description This command configures the router ID for the router instance.

The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager.

IS-IS uses the router ID value as its system ID.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when

different protocols use different router IDs.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for each protocol

that uses the router ID, or restart the entire router.

The **no** form of the command to reverts to the default value.

Default The system uses the system interface address (which is also the loopback address).

If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

Parameters router-id — The 32 bit router ID expressed in dotted decimal notation or as a decimal value.

Show Commands

router

Syntax router [router-instance]

Context show

Description Displays router instance information.

Parameters router-instance — Specify either the router-name or service-id

Values router-name: Base, management

service-id: 1 — 2147483647

Default Base

bgp

Syntax bgp

Context show>router

Description Enables the context to display BGP related information.

auth-keychain

Syntax auth-keychain [keychain]

Context show>router>bgp

show>router>bgp>group

show>router>bgp>group>neighbor

Description This command displays BGP sessions using particular authentication key-chain.

Parameters *keychain* — Specifies an existing keychain name.

Sample Output

*A:ALA-48# show router 2 bgp auth-keychain

Sessions using key chains

Peer address	Group	Keychain name

damping

damping [damp-type] [detail] Syntax 5 4 1

damping [ip-prefix | prefix-length] [detail]

Context show>router>bgp

Description This command displays BGP routes which have been dampened due to route flapping. This command can be entered with or without a route parameter.

When the keyword **detail** is included, more detailed information displays.

When only the command is entered (without any parameters included except detail), then all dampened routes are listed.

When a parameter is specified, then the matching route or routes are listed.

When a **decayed**, **history**, or **suppressed** keyword is specified, only those types of dampened routes are listed.

Parameters *ip-prefix* — Displays damping information for the specified IP prefix and length.

> **Values** ipv4-prefix a.b.c.d (host bits must be 0)

> > ipv4-prefix-length 0 - 32

ipv6-prefix x:x:x:x:x:x:x (eight 16-bit pieces)

> x:x:x:x:x:d.d.d.d x: [0 — FFFF]H

$$\begin{array}{c} \text{d:} & [0-255] \text{D} \\ \text{ipv6-prefix-length} & 0-128 \end{array}$$

damp-type — Specifies the type of damping to display.

Values decayed — Displays damping entries that are decayed but are not suppressed.

history — Displays damping entries that are withdrawn but have history. **suppressed** —

Displays damping entries suppressed because of route damping.

detail — Displays detailed information.

Output Damping Output Fields — The following table describes BGP damping output fields.

Label	Description			
BGP Router ID	The local BGP router ID.			
The local BGP router ID.	The configured autonomous system number.			
Local AS	The configured or inherited local AS for the specified peer group. If not configured, then it is the same value as the AS.			
Network	Route IP prefix and mask length for the route.			
Flag(s)	Legend: Status codes: u- used, s-suppressed, h-history, d-decayed, *-valid. If a * is not present, then the status is invalid. Origin codes: i-IGP, e-EGP, ?-incomplete, >-best			
From	The originator ID path attribute value.			
Reuse time	The time when a suppressed route can be used again.			
From	The originator ID path attribute value.			
Reuse time	The time when a suppressed route can be used again.			
AS Path	The BGP AS path for the route.			
Peer	The router ID of the advertising router.			
NextHop	BGP nexthop for the route.			
Peer AS	The autonomous system number of the advertising router.			
Peer Router-Id	The router ID of the advertising router.			
Local Pref	BGP local preference path attribute for the route.			
Age	The length of time in hour/minute/second (HH:MM:SS) format.			
Last update	The time when BGP was updated last in day/hour/minute (DD:HH:MM) format.			
FOM Present	The current Figure of Merit (FOM) value.			

Label Description (Cor	ıtinued)
------------------------	----------

Number of Flaps	The number of route flaps in the neighbor connection.
Reuse time	The time when the route can be reused.
Path	The BGP AS path for the route.
Applied Policy	The applied route policy name.

Sample Output

A:ALA-12# show router bgp damping

group

group [name] [detail] Syntax

Context show>router>bgp

Description This command displays group information for a BGP peer group. This command can be entered with or without parameters.

When this command is entered without a group name, information about all peer groups displays.

When the command is issued with a specific group name, information only pertaining to that specific peer group displays.

The 'State' field displays the BGP group's operational state. Valid states are:

Up — BGP global process is configured and running.

Down — BGP global process is administratively shutdown and not running.

Disabled — BGP global process is operationally disabled. The process must be restarted by the operator.

Parameters name — Displays information for the BGP group specified.

detail — Displays detailed information.

Output Standard and Detailed Group Output — The following table describes the standard and detailed command output fields for a BGP group.

Label	Description		
Group	Displays the BGP group name.		
Group Type	No Type - Peer type not configured.		
	External — Peer type configured as external BGP peers.		
	Internal - Peer type configured as internal BGP peers.		
State	Disabled - The BGP peer group has been operationally disabled.		
	Down - The BGP peer group is operationally inactive.		
	Up - The BGP peer group is operationally active.		
Peer AS	The configured or inherited peer AS for the specified peer group.		
Local AS	The configured or inherited local AS for the specified peer group.		
Local Address	The configured or inherited local address for originating peering for the specified peer group.		
Loop Detect	The configured or inherited loop detect setting for the specified peer group.		
Connect Retry	The configured or inherited connect retry timer value.		
Authentication	None - No authentication is configured.		
	MD5 - MD5 authentication is configured.		
Bfd	Yes - BFD is enabled.		
	No - BFD is disabled.		
Local Pref	The configured or inherited local preference value.		
MED Out	The configured or inherited MED value assigned to advertised routes without a MED attribute.		
Min Route Advt.	The minimum amount of time that must pass between route updates for the same IP prefix.		
Min AS Originate	The minimum amount of time that must pass between updates for a route originated by the local router.		
Multihop	The maximum number of router hops a BGP connection can traverse.		
Prefix Limit	No Limit $-$ No route limit assigned to the BGP peer group.		
	1 — 4294967295 — The maximum number of routes BGP can learn from a peer.		

Label	Description (Continued)		
Passive	Disabled - BGP attempts to establish a BGP connection with neighbor in the specified peer group.		
	Enabled - BGP will not actively attempt to establish a BGP connection with neighbor in the specified peer group.		
Next Hop Self	Disabled - BGP is not configured to send only its own IP address as the BGP nexthop in route updates to neighbors in the peer group.		
	Enabled — BGP sends only its own IP address as the BGP nexthop in route updates to neighbors in the specified peer group.		
Aggregator ID 0	Disabled $-$ BGP is not configured to set the aggregator ID to $0.0.0.0$ in all originated route aggregates sent to the neighbor in the peer group.		
	Enabled $-$ BGP is configured to set the aggregator ID to $0.0.0.0$ in all originated route aggregates sent to the neighbor in the peer group.		
Remove Private	Disabled - BGP will not remove all private AS numbers from the AS path attribute in updates sent to the neighbor in the peer group.		
	Enabled - BGP removes all private AS numbers from the AS path attribute in updates sent to the neighbor in the peer group.		
Damping	Disabled — The peer group is configured not to dampen route flaps.		
	Enabled $-$ The peer group is configured to dampen route flaps.		
Export Policy	The configured export policies for the peer group.		
Import Policy	The configured import policies for the peer group.		
Hold Time	The configured hold time setting.		
Keep Alive	The configured keepalive setting.		
Cluster Id	The configured route reflector cluster ID.		
	None - No cluster ID has been configured		
Client Reflect	Disabled - The BGP route reflector will not reflect routes to this neighbor.		
	Enabled — The BGP route reflector is configured to reflect routes to this neighbor.		
NLRI	The type of NLRI information that the specified peer group can accept.		
	Unicast — IPv4 unicast routing information can be carried.		
Preference	The configured route preference value for the peer group.		

Label	Description	(Continued)
Labei	Description	(Continued)

List of Peers A list of BGP peers configured under the peer group. Total Peers The total number of peers configured under the peer group. Established The total number of peers that are in an established state.

neighbor

Syntax neighbor [ip-address [[family] filter1 [brief]]]

neighbor [as-number [[family family] filter2]] neighbor [ip-address | ipv6-address] orf [filter3] neighbor[ip-address | ipv6-address] graceful-restart

Context show>router>bgp

Description This command displays BGP neighbor information. This command can be entered with or without any parameters.

When this command is issued without any parameters, information about all BGP peers displays.

When the command is issued with a specific IP address or ASN, information regarding only that specific peer or peers with the same AS displays.

When either **received-routes** or **advertised-routes** is specified, then the routes received from or sent to the specified peer is listed (see second output example).

Note: This information is not available by SNMP.

When either **history** or **suppressed** is specified, then the routes learned from those peers that either have a history or are suppressed (respectively) are listed.

The 'State' field displays the BGP peer's protocol state. In additional to the standard protocol states, this field can also display the 'Disabled' operational state which indicates the peer is operationally disabled and must be restarted by the operator.

Parameters

ip-address — Display information for the specified IP address.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x[-interface])

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses.

as-number — Display information for the specified AS number.

Values 1 — 65535

family — Specify the type of routing information to be distributed by this peer group.

Values ipv4 — Displays only those BGP peers that have the IPv4 family enable and not those

capable of exchanging IP-VPN routes. **vpn-ipv4** — Displays the content of the multicast routing table.

ipv6 — Displays the BGP peers that are IPv6 capable.

mcast-ipv4 — Displays the BGP peers that are mcast-ipv4 capable.

filter1 — Display information for the specified IP address.

Values received-routes — Displays the number of routes received from this peer.

advertised-routes — Displays the number of routes advertised by this peer.

history — Displays statistics for dampened routes.

suppressed — Displays the number of paths from this peer that have been suppressed by

damping.

detail — Displays detailed information pertaining to *filter1*.

filter2 — Display information for the specified AS number.

Values history — Display statistics for dampened routes.

suppressed — Display the number of paths from this peer that have been suppressed by damping

detail — Displays detailed information pertaining to *filter2*

brief — Displays information in a brief format. This parameter is only supported with received-routes and advertised-routes.

orf — Displays outbound route filtering for the BGP instance. ORF (Outbound Route Filtering) is used to inform a neighbor of targets (using target-list) that it is willing to receive. This mechanism helps lessen the update exchanges between neighbors and saves CPU cycles to process routes that could have been received from the neighbor only to be dropped/ignored.

filter3 — Displays path information for the specified IP address.

Values send — Displays the number of paths sent to this peer.

receive — Displays the number of paths received from this peer.

graceful-restart — Displays neighbors configured for graceful restart.

Output

Standard and Detailed Neighbor — The following table describes the standard and detailed command output fields for a BGP neighbor.

Label	Description		
Peer	The IP address of the configured BGP peer.		
Group	The BGP peer group to which this peer is assigned.		
Peer AS	The configured or inherited peer AS for the peer group.		
Peer Address	The configured address for the BGP peer.		
Peer Port	The TCP port number used on the far-end system.		
Local AS	The configured or inherited local AS for the peer group.		
Local Address	The configured or inherited local address for originating peering for the peer group.		
Local Port	The TCP port number used on the local system.		
Peer Type	External — Peer type configured as external BGP peers.		
	Internal — Peer type configured as internal BGP peers.		
Bfd	Yes - BFD is enabled.		
	No - BFD is disabled.		
State	Idle - The BGP peer is not accepting connections.		

Label	Description (Continued)
	$\label{eq:active-BGP} \mbox{ Active } - \mbox{ BGP is listening for and accepting TCP connections from this peer.}$
	Connect $-$ BGP is attempting to establish a TCP connections from this peer.
	Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer.
	Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION.
Last State	Idle - The BGP peer is not accepting connections.
	$\label{eq:Active} \mbox{$-$ BGP$ is listening for and accepting TCP connections from this peer.}$
	Connect - BGP is attempting to establish a TCP connections from this peer.
	Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer.
	Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION.
Last Event	start - BGP has initialized the BGP neighbor.
	stop — BGP has disabled the BGP neighbor.
	open - BGP transport connection opened.
	close - BGP transport connection closed.
	openFail - BGP transport connection failed to open.
	error - BGP transport connection error.
	connectRetry - Connect retry timer expired.
	holdTime - Hold time timer expired.
	keepAlive - Keepalive timer expired.
	recvOpen - Receive an OPEN message.
	revKeepalive - Receive a KEEPALIVE message.
	recvUpdate - Receive an UPDATE message.
	recvNotify - Receive a NOTIFICATION message.

Label	Description (Continued)		
	None - No events have occurred.		
Last Error	Displays the last BGP error and subcode to occur on the BGP neighbor.		
Connect Retry	The configured or inherited connect retry timer value.		
Local Pref.	The configured or inherited local preference value.		
Min Route Advt.	The minimum amount of time that must pass between route updates for the same IP prefix.		
Min AS Originate	The minimum amount of time that must pass between updates for a route originated by the local router.		
Multihop	The maximum number of router hops a BGP connection can traverse.		
Damping	Disabled - BGP neighbor is configured not to dampen route flaps.		
	Enabled - BGP neighbor is configured to dampen route flaps.		
Loop Detect	Ignore — The BGP neighbor is configured to ignore routes with an AS loop.		
	${\tt Drop}$ — The BGP neighbor is configured to drop the BGP peering if an AS loop is detected.		
	Off - AS loop detection is disabled for the neighbor.		
MED Out	The configured or inherited MED value assigned to advertised routes without a MED attribute.		
Authentication	None - No authentication is configured.		
	MD5 - MD5 authentication is configured.		
Next Hop Self	$\begin{array}{ll} {\tt Disabled-BGP} \ is \ not \ configured \ to \ send \ only \ its \ own \ IP \ address \\ as \ the \ BGP \ nexthop \ in \ route \ updates \ to \ the \ specified \ neighbor. \end{array}$		
	Enabled — BGP will send only its own IP address as the BGP nexthop in route updates to the neighbor.		
AggregatorID Zero	eq:Disabled-		
	Enabled $-$ The BGP Neighbor is configured to set the aggregator ID to $0.0.0.0$ in all originated route aggregates.		
Remove Private	Disabled - BGP will not remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor.		

Label	Description (Continued)		
	Enabled — BGP will remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor.		
Passive	$\label{eq:def:Disabled-BGP} \begin{tabular}{ll} Disabled-BGP will actively attempt to establish a BGP connection with the specified neighbor. \end{tabular}$		
	Enabled $-$ BGP will not actively attempt to establish a BGP connection with the specified neighbor.		
Prefix Limit	No Limit - No route limit assigned to the BGP peer group.		
	1 - 4294967295 — The maximum number of routes BGP can learn from a peer.		
Hold Time	The configured hold time setting.		
Keep Alive	The configured keepalive setting.		
Active Hold Time	The negotiated hold time, if the BGP neighbor is in an established state.		
Active Keep Alive	The negotiated keepalive time, if the BGP neighbor is in an established state.		
Cluster Id	The configured route reflector cluster ID.		
	None - No cluster ID has been configured.		
Client Reflect	Disabled — The BGP route reflector is configured not to reflect routes to this neighbor.		
	Enabled — The BGP route reflector is configured to reflect routes to this neighbor.		
Preference	The configured route preference value for the peer group.		
Num of Flaps	The number of route flaps in the neighbor connection		
Recd. Prefixes	The number of routes received from the BGP neighbor.		
Active Prefixes	The number of routes received from the BGP neighbor and active in the forwarding table.		
Recd. Paths	The number of unique sets of path attributes received from the BGP neighbor.		
Suppressed Paths	The number of unique sets of path attributes received from the BGP neighbor and suppressed due to route damping.		
Input Queue	The number of BGP messages to be processed.		
Output Queue	The number of BGP messages to be transmitted.		
i/p Messages	Total number of packets received from the BGP neighbor.		

Label	Description (Continued)
o/p Messages	Total number of packets sent to the BGP neighbor.
i/p Octets	Total number of octets received from the BGP neighbor.
o/p Octets	Total number of octets sent to the BGP neighbor.
Export Policy	The configured export policies for the peer group.
Import Policy	The configured import policies for the peer group.

Advertised and Received Routes Ouptut — The following table describes the command output for both the standard and detailed information for a neighor.

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then it is the same value as the AS.
Flag	u – used
	s — suppressed
	h – history
	d – decayed
	* — valid
	i — igp
	e – egp
	? – incomplete
	> - best
Network	Route IP prefix and mask length for the route.
Next Hop	BGP nexthop for the route.
LocalPref	BGP local preference path attribute for the route.
MED	BGP Multi-Exit Discriminator (MED) path attribute for the route.
AS Path	The BGP AS path for the route.

```

next-hop

Syntax next-hop [family] [ip-address] [detail]

Context show>router>bgp

Description Displays BGP next-hop information.

Parameters family — Specify the type of routing information to be distributed by the BGP instance.

> **Values** ipv4 — Displays only those BGP peers that have the IPv4 family enable and not those

capable of exchanging IP-VPN routes.

vpn-ipv4 — Displays the BGP peers that are IP-VPN capable.

ipv6 — Displays the BGP peers that are IPv6 capable.

mcast-ipv4 — Displays the BGP peers that are mcast-ipv4 capable.

ip-address — Displays the next hop information for the specified IP address.

Values ipv4-address: a.b.c.d (host bits must be 0)

> ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

> > x:x:x:x:x:d.d.d.dx [0 — FFFF]H d [0 — 255]D

detail — Display the longer, more detailed version of the output.

Output Show Next-Hop Output — The following table describes the command output fields for a BGP next hop.

Label	Description
BGP ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
Next Hop	The next-hop address.
Resolving Prefix	Displays the prefix of the best next hop.
Owner	Displays the routing protocol used to derive the best next hop.
Preference	Displays the BGP preference attribute for the routes.
Reference Count	Displays the number of routes using the resolving prefix.
Resolved Next Hop	The IP address of the next hop.

BGP Router ID:10.20.1.3	AS:5000	Local AS:5000		
			======	=======

paths

Syntax paths

Context show>router>bgp

Description

This command displays a summary of BGP path attributes.

Output **Show Path Output** — The following table describes the command output fields for a BGP path.

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
Path	The AS path attribute.
Origin	EGP - The NLRI is learned by an EGP protocol.
	IGP - The NLRI is interior to the originating AS.
	INCOMPLETE - NLRI was learned another way.
Next Hop	The advertised BGP nexthop.
MED	The Multi-Exit Discriminator value.
Local Preference	The local preference value. This value is used if the BGP route arrives from a BGP peer without the Local Pref attribute set. It is overridden by any value set via a route policy.
Refs	The number of routes using a specified set of path attributes.
ASes	The number of autonomous system numbers in the AS path attribute.
Segments	The number of segments in the AS path attribute.
Flags	EBGP-learned - Path attributes learned by an EBGP peering.
	IBGP-Learned - Path attributes learned by an IBGP peering.
Aggregator	The route aggregator ID.
Community	The BGP community attribute list.

Label Descr	iption	(Continued)
-------------	--------	-------------

Originator ID The originator ID path attribute value.

Cluster List The route reflector cluster list.

Sample Output

show>router>bgp Context

Description This command displays BGP route information.

When this command is issued without any parameters, then the entire BGP routing table displays.

When this command is issued with an IP prefix/mask or IP address, then the best match for the parameter displays.

Parameters

family — Specify the type of routing information to be distributed by the BGP instance.

Values

ipv4 — Displays only those BGP peers that have the IPv4 family enable and not those capable of exchanging IP-VPN routes.

vpn-ipv4 — Displays the BGP peers that are IP-VPN capable.

ipv6 — Displays the BGP peers that are IPv6 capable.

mcast-ipv4 — Displays the BGP peers that are mcast-ipv4 capable.

received — Specifies to show the BGP routes received from the neighbor,

prefix — Specifies the type of routing information to display.

Values rd:[ip-address[/mask]] rd ip-ad ip-ad

mask

rd ip-address:number1

as-number1:number2
as-number2:number3

number1 1 — 65535 as-number1 1 — 65535 number2 0 — 4294967295 as-number2 1 — 4294967295 number3 0 — 65535 ip-addres a.b.c.d

0 - 32

ipv6-prefix[/pref* ipv6-prefix x:x:x:x:x:x:x: (eight 16-bit pieces)

x:x:x:x:x:x:d.d.d.d x: [0 - FFFF]Hd: [0 - 255]D

prefix-length 0 - 128

filter — Specifies route criteria.

Values

hunt Displays entries for the specified route in the RIB-In, RIB-Out, and RTM.

longer Displays the specified route and subsets of the route.

detail Display the longer, more detailed version of the output.

aspath-regex "reg-exp" — Displays all routes with an AS path matching the specified regular expression reg-exp.

community comm.-id — Displays all routes with the specified BGP community.

Values

[as-number1:comm-val1 | ext-comm | well-known-comm]

ext-comm type:{ip-address:comm-val1 | as-number1:comm-val2 | as-

number2:comm-val1}

 $\begin{array}{lll} \text{as-number1} & 0 - 65535 \\ \text{comm-val1} & 0 - 65535 \\ \text{type} & \text{target, origin} \\ \text{ip-address} & \text{a.b.c.d} \end{array}$

comm-val2 0 — 4294967295 as-number2 0 — 4294967295

well-known-comm no-export, no-export-subconfed, no-advertise

brief — Provides a summarized display of the set of peers to which a BGP route is advertised.

 $\textit{rd} - \text{Pip-addr:comm-val} \mid 2 \text{byte-asnumber:ext-comm-val} \mid 4 \text{byte-asnumber:comm-val} \rbrace$

veid — [0..4294967295 vpls-base-offset — 0..4294967295

site-id — 0..4294967295

l2vpn-type — bgp-ad | bgp-vpls | multi-homing

Output

BGP Route — The following table describes the command output fields for BGP routes.

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
Route Dist.	Displays the route distinguisher identifier attached to routes that distinguishes the VPN it belongs.
VPN Label	Displays the label generated by the PE's label manager.
Network	The IP prefix and mask length.
Nexthop	The BGP nexthop.
From	The advertising BGP neighbor's IP address.
Res. Nexthop	The resolved nexthop.
Local Pref.	The local preference value. This value is used if the BGP route arrives from a BGP peer without the Local Pref attribute set. It is overridden by any value set via a route policy.
Flag	u – used
	s — suppressed
	h – history
	d — decayed
	* – valid
	i — igp
	e – egp
	? – incomplete
	> — best
Aggregator AS	The aggregator AS value. none — Aggregator AS attributes are not present.

Label	Description (Continued)
Aggregator	The aggregator attribute value. none — Aggregator attributes are not present.
Atomic Aggr.	Atomic - The atomic aggregator flag is set.
	Not Atomic $-$ The atomic aggregator flag is not set.
MED	The MED metric value.
	none – MED metrics are present.
Community	The BGP community attribute list.
Cluster	The route reflector cluster list.
Originator Id	The originator ID path attribute value.
	none - The originator ID attribute is not present.
Peer Router Id	The router ID of the advertising router.
AS-Path	The BGP AS path attribute.
VPRN Imported	Displays the VPRNs where a particular BGP-VPN received route has been imported and installed.

summary

Syntax summary [all]

summary [family family] [neighbor ip-address]

Context show>router>bgp

Description This command displays a summary of BGP neighbor information.

If confederations are not configured, that portion of the output will not display.

The "State" field displays the global BGP operational state. The valid values are:

Up — BGP global process is configured and running.

Down — BGP global process is administratively shutdown and not running.

Disabled — BGP global process is operationally disabled. The process must be restarted by the operator.

For example, if a BGP peer is operationally disabled, then the state in the summary table shows the state 'Disabled'

Parameters family — Specify the type of routing information to be distributed by the BGP instance.

> **Values ipv4** — Displays only those BGP peers that have the IPv4 family enabled.

> > **vpn-ipv4** — Displays the BGP peers that are IP-VPN capable.

ipv6 — Displays the BGP peers that are IPv6 capable.

mcast-ipv4 — Displays the BGP peers that are mcast-ipv4 capable.

neighbor *ip-address* — Clears damping information for entries received from the BGP neighbor.

Values ipv4-address: a.b.c.d

> ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

> > x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

Output BGP Summary Output — The following table describes the command output fields for a BGP summary.

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
BGP Admin State	Down - BGP is administratively disabled.
	Up - BGP is administratively enabled.
BGP Oper State	Down - BGP is operationally disabled.
	Up - BGP is operationally enabled.
Bfd	Yes - BFD is enabled.
	No - BFD is disabled.
Confederation AS	The configured confederation AS.
Member Confedera- tions	The configured members of the BGP confederation.
Number of Peer Groups	The total number of configured BGP peer groups.
Number of Peers	The total number of configured BGP peers.
Total BGP Active Routes	The total number of BGP routes used in the forwarding table.
Total BGP Routes	The total number of BGP routes learned from BGP peers.
Total BGP Paths	The total number of unique sets of BGP path attributes learned from BGP peers.
Total Path Memory	Total amount of memory used to store the path attributes.
Total Suppressed Routes	Total number of suppressed routes due to route damping.
Total History Routes	Total number of routes with history due to route damping.
Total Decayed Routes	Total number of decayed routes due to route damping.
Total VPN Peer Groups	The total number of configured VPN peer groups.
Total VPN Peers	The total number of configured VPN peers.
Total VPN Local Rts	The total number of configured local VPN routes.

Label	Description (Continued)
Total VPN Remote Rts	The total number of configured remote VPN routes.
Total VPN Remote Active Rts.	The total number of active remote VPN routes used in the forwarding table.
Total VPN Supp.Rts.	Total number of suppressed VPN routes due to route damping.
Total VPN Hist. Rts.	Total number of VPN routes with history due to route damping.
Total VPN Decay Rts.	Total number of decayed routes due to route damping.
Neighbor	BGP neighbor address.
AS (Neighbor)	BGP neighbor autonomous system number.
PktRcvd	Total number of packets received from the BGP neighbor.
PktSent	Total number of packets sent to the BGP neighbor.
InQ	The number of BGP messages to be processed.
OutQ	The number of BGP messages to be transmitted.
Up/Down	The amount of time that the BGP neighbor has either been established or not established depending on its current state.
State Recv/Actv/ Sent	The BGP neighbor's current state (if not established) or the number of received routes, active routes and sent routes (if established).

Clear Commands

damping

Syntax damping [[ip-prefix/ip-prefix-length] [neighbor ip-address]] | [group name]

Context clear>router>bgp

Description This command clears or resets the route damping information for received routes.

Parameters *ip-prefix/ip-prefix-length* — Clears damping information for entries that match the IP prefix and prefix

length.

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-length: 0 - 32

ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

ipv6-prefix-length: 0 - 128

neighbor *ip-address* — Clears damping information for entries received from the BGP neighbor.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

interface: 32 chars maximum, mandatory

Values for link local addresses

group name — Clears damping information for entries received from any BGP neighbors in the peer group.

Values 32 characters maximum

flap-statistics

Syntax flap-statistics [[ip-prefixImask] [neighbor ip-address]] | [group group-name] | [regex reg-exp] |

[policy policy-name]

Context clear>router>bgp

Description This command clears route flap statistics.

Parameters *ip-prefix/mask* — Clears route flap statistics for entries that match the specified IP prefix and mask length.

Values ip-prefix: a.b.c.d (host bits must be 0)

mask: 0 — 32

neighbor ip-address — Clears route flap statistics for entries received from the specified BGP neighbor.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

group *group-name* — Clears route flap statistics for entries received from any BGP neighbors in the specified peer group.

regex *reg-exp* — Clears route flap statistics for all entries which have the regular expression and the AS path that matches the regular expression.

policy policy-name — Clears route flap statistics for entries that match the specified route policy.

neighbor

Syntax neighbor {ip-address | as as-number | external | all} [soft | soft-inbound]

neighbor{ip-address | as as-number | external | all} statistics

neighbor ip-address end-of-rib

Context clear>router>bgp

Description This command resets the specified BGP peer or peers. This can cause existing BGP connections to be

shutdown and restarted.

Parameters *ip-address* — Resets the BGP neighbor with the specified IP address.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses

as as-number — Resets all BGP neighbors with the specified peer AS.

Values 1 — 65535

external — Resets all EBGP neighbors.

all — Resets all BGP neighbors.

soft — The specified BGP neighbor(s) re-evaluates all routes in the Local-RIB against the configured export policies.

soft-inbound — The specified BGP neighbor(s) re-evaluates all routes in the RIB-In against the configures import policies.

statistics — The BGP neighbor statistics.

end-of-rib — Clears the routing information base (RIB).

Clear Commands

protocol

Syntax protocol

Context clear>router>bgp

Description Resets the entire BGP protocol.

Debug Commands

events

Syntax events [neighbor ip-address | group name]

no events

Context debug>router>bgp

Description This command logs all events changing the state of a BGP peer.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x [-interface] (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d [-interface]

x [0 — FFFF]H d [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses

group name — Debugs only events affecting the specified peer group and associated neighbors.

graceful-restart

Syntax graceful-restart [neighbor ip-address | group name]

no graceful-restart

Context debug>router>bgp

Description This command enables debugging for BGP graceful-restart.

The no form of the command disables the debugging.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

Debug Commands

keepalive

Syntax keepalive [neighbor ip-addr | group name]

no keepalive

Context debug>router>bgp

Description This command decodes and logs all sent and received keepalive messages in the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

notification

Syntax notification [neighbor ip-address | group name]

no notification

Context debug>router>bgp

Description This command decodes and logs all sent and received notification messages in the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

open

Syntax open [neighbor ip-address | group name]

no open

Context debug>router>bgp

Description This command decodes and logs all sent and received open messages in the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

outbound-route-filtering

Syntax [no] outbound-route-filtering

Context debug>router>bgp

Description This command enables debugging for for all BGP outbound route filtering (ORF) packets. ORF is used to

inform a neighbor of targets (using target-list) that it is willing to receive.

packets

Syntax packets [neighbor ip-address | group name]

packets

Context debug>router>bgp

Description This command decodes and logs all sent and received BGP packets in the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

Debug Commands

route-refresh

Syntax route-refresh [neighbor ip-address | group name]

no route-refresh

Context debug>router>bgp

Description Thic command enables and disables debugging for BGP route-refresh.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:x[-interface] x:x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

rtm

Syntax rtm [neighbor ip-address | group name]

no rtm

Context debug>router>bgp

Description This command logs RTM changes in the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

socket

Syntax socket [**neighbor** *ip-address* | **group** *name*]

no socket

Context debug>router>bgp

Description This command logs all TCP socket events to the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group *name* — Debugs only events affecting the specified peer group and associated neighbors.

timers

Syntax timers [**neighbor** *ip-address* | **group** *name*]

no timers

Context debug>router>bgp

Description This command logs all BGP timer events to the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface: 32 characters maximum, mandatory for link local

addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

update

Syntax update [neighbor ip-address | group name]

no update

Context debug>router>bgp

Description This command decodes and logs all sent and received update messages in the debug log.

Parameters neighbor *ip-address* — Debugs only events affecting the specified BGP neighbor.

Values ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x:[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

Debug Commands

interface: 32 characters maximum, mandatory for link local addresses)

group name — Debugs only events affecting the specified peer group and associated neighbors.

Route Policies

In This Chapter

This chapter provides information about configuring route policies.

Topics in this chapter include:

- Configuring Route Policies on page 658
 - → Policy Statements on page 659
 - Default Action Behavior on page 660
 - → BGP and OSPF Route Policy Support on page 668
 - BGP Route Policies on page 668
 - Re-advertised Route Policies on page 670
 - → When to Use Route Policies on page 671
- Route Policy Configuration Process Overview on page 672
- Configuration Notes on page 673

Configuring Route Policies

Alcatel-Lucent's 7750 SR OS supports two databases for routing information. The routing database is composed of the routing information learned by the routing protocols. The forwarding database is composed of the routes actually used to forward traffic through a router. In addition, link state databases are maintained by interior gateway protocols (IGPs) such as IS-IS and OSPF.

Routing protocols calculate the best route to each destination and place these routes in a forwarding table. The routes in the forwarding table are used to forward routing protocol traffic, sending advertisements to neighbors and peers.

A routing policy can be configured that will not place routes associated with a specific origin in the routing table. Those routes will not be used to forward data packets to the intended destinations and the routes are not advertised by the routing protocol to neighbors and peers.

Routing policies control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination. Careful planning is essential to implement route policies that can affect the flow of routing information or packets in and traversing through the router. Before configuring and applying a route policy, develop an overall plan and strategy to accomplish your intended routing actions.

There are no default route policies. Each policy must be created explicitly and applied to a routing protocol or to the forwarding table. Policy parameters are modifiable.

Policy Statements

Route policies contain policy statements containing ordered entries containing match conditions and actions you specify. The entries should be sequenced from the most explicit to least explicit. Packet forwarding and routing can be implemented according to your defined policies. Policy-based routing allows you to dictate where traffic can be routed, through specific paths, or whether to forward or drop the traffic. Route policies can match a given route policy entry and continue searching for other matches within either the same route policy or the next route policy.

The process can stop when the first complete match is found and executes the action defined in the entry, either to accept or reject packets that match the criteria or proceed to the next entry or the next policy. You can specify matching criteria based on source, destination, or particular properties of a route. Route policies can be constructed to support multiple stages to the evaluation and setting various route attributes. You can also provide more matching conditions by specifying criteria such as:

- Autonomous system (AS) path policy options A combination of AS numbers and regular expression operators.
- Community list A group sharing a common property.
- Prefix list A named list of prefixes.
- To and From criteria A route's source and destination.

Default Action Behavior

The default action specifies how packets are to be processed when a policy related to the route is not explicitly configured. The following default actions are applied in the event that:

- A route policy does not specify a matching condition, all the routes being compared with the route policy are considered to be matches.
- A packet does not match any policy entries, then the next policy is evaluated. If a match does not occur then the last entry in the last policy is evaluated.
- If no default action is specified, the default behavior of the protocol controls whether the routes match or not.

If a default action is defined for one or more of the configured route policies, then the default action is handled as follows:

- The default action can be set to all available action states including accept, reject, next-entry, and next-policy.
- If the action states accept or reject, then the policy evaluation terminates and the appropriate result is returned.
- If a default action is defined and no matches occurred with the entries in the policy, then the default action is used.
- If a default action is defined and one or more matches occurred with the entries of the policy, then the default action is not used.

Denied IP Prefixes

The following IP address prefixes are not allowed by the routing protocols and the Route Table Manager and are not be populated within the forwarding table:

- 0.0.0.0/8 or longer
- 127.0.0.0/8 or longer
- 224.0.0.0/4 or longer
- 240.0.0.0/4 or longer

Any other prefixes that need to be filtered can be filtered explicitly using route policies.

Controlling Route Flapping

Route damping is a controlled acceptance of unstable routes from BGP peers so that any ripple effect caused by route flapping across BGP AS border routers is minimized. The motive is to delay the use of unstable routes (flapping routes) to forward data and advertisements until the route stabilizes.

Alcatel-Lucent's implementation of route damping is based on the following parameters:

- Figure of Merit A route is assigned a Figure of Merit (FoM), which is proportional to
 the frequency of flaps. FoM should be able to characterize a route's behavior over a period
 of time.
- Route flap A route flap is not limited to the withdrawn route. It also applies to any change in the AS path or the next hop of a reachable route. A change in AS path or next hop indicates that the intermediate AS or the route-advertising peer is not suppressing flapping routes at the source or during the propagation. Even if the route is accepted as a stable route, the data packets destined to the route could experience unstable routing due to the unstable AS path or next hop.
- Suppress threshold The threshold is a configured value that, when exceeded, the route is suppressed and not advertised to other peers. The state is considered to be down from the perspective of the routing protocol.
- Reuse threshold When FoM value falls below a configured reuse threshold and the
 route is still reachable, the route is advertised to other peers.
 The FoM value decays exponentially after a route is suppressed. This requires the BGP
 implementation to decay thousands of routes from a misbehaving peer.

The two events that could trigger the route flapping algorithm are:

- Route flapping If a route flap is detected within a configured maximum route flap
 history time, the route's FoM is initialized and the route is marked as a potentially unstable
 route. Every time a route flaps, the FoM is increased and the route is suppressed if the
 FoM crosses the suppress threshold.
- Route reuse timer trigger A suppressed route's FoM decays exponentially. When it crosses the reuse threshold, the route is eligible for advertisement if it is still reachable.

If the route continues to flap, the FoM, with respect to time scale, looks like a sawtooth waveform with the exponential rise and decay of FoM. To control flapping, the following parameters can be configured:

• half-life — The half life value is the time, expressed in minutes, required for a route to remain stable in order for one half of the FoM value to be reduced. For example, if the half life value is 6 (minutes) and the route remains stable for 6 minutes, then the new FoM

Configuring Route Policies

value is 3. After another 6 minutes passes and the route remains stable, the new FoM value is 1.5.

- max-suppress The maximum suppression time, expressed in minutes, is the maximum amount of time that a route can remain suppressed.
- suppress If the FoM value exceeds the configured integer value, the route is suppressed for use or inclusion in advertisements.
- reuse If the suppress value falls below the configured reuse value, then the route can be reused.

Regular Expressions

The ability to perform a filter match on confederations in the AS-PATH is supported. This feature allows customers to configure match criteria for specific confederation sets and sequences within the AS path so that they can be filtered out before cluttering the service provider's routing information base (RIB).

TiMOS uses regular expression strings to specify match criteria for:

- An AS path string; for example, "100 200 300"
- A community string; for example, "100:200" where 100 is the AS number, and 200 is the community-value.
- Any AS path beginning with a confederation SET or SEQ containing 65001 and 65002 only: for example "< 65001 65002 >.*"
- Any AS path containing a confederation SET or SEQ, regardless of the contents: for example, ".* <.*> .*"

A regular expression is expressed in terms of terms and operators. A term for an AS path regular expression is:

- 1. Regular expressions should always be enclosed in quotes.
- 2. An elementary term; for example, an AS number "200"
- 3. A range term composed of two elementary terms separated by the '-' character like "200-300".
- 4. The '.' dot wild-card character which matches any elementary term.
- 5. A regular expression enclosed in parenthesis "()".
- 6. A regular expression enclosed in square brackets used to specify a set of choices of elementary or range terms; for example. [100-300 400] matches any AS number between 100 and 300 or the AS number 400.

A term for a community string regular expression is a string that is evaluated character by character and is composed of:

- 1. An elementary term which for a community string is any single digit like "4".
- 2. A range term composed of two elementary terms separated by the '-' character like "2-3".
- 3. A colon ':' to delimit the AS number from the community value
- 4. The '.' dot wild-card character which matches any elementary term or ':'.
- 5. A regular expression enclosed in parenthesis "()".

6. A regular expression enclosed in square brackets used to specify a set of choices of elementary or range terms; for example, [1-37] matches any single digit between 1 and 3 or the digit 7.

The regular expression OPERATORS are listed in Table 16.

Table 16: Regular Expression Operators

Operator	Description
	Matches the term on alternate sides of the pipe.
*	Matches multiple occurrences of the term.
?	Matches 0 or 1 occurrence of the term.
+	Matches 1 or more occurrence of the term.
()	Used to parenthesize so a regular expression is considered as one term.
[]	Used to demarcate a set of elementary or range terms.
-	Used between the start and end of a range.
{m,n}	Matches least m and at most n repetitions of the term.
$\{m\}$	Matches exactly m repetitions of the term.
{m,}	Matches m or more repetitions of the term.
^	Matches the beginning of the string - only allowed for communities.
\$	Matches the end of the string - only allowed for communities.
\	An escape character to indicate that the following character is a match criteria and not a grouping delimiter.
<>	Matches any AS path numbers containing a confederation SET or SEQ.

Examples of AS path and community string regular expressions are listed in Table 17.

Table 17: AS Path and Community Regular Expression Examples

AS Path to Match Criteria	Regular Expression	Example Matches
Null AS path	null ^a	Null AS path
AS path is 11	11	11
AS path is 11 22 33	11 22 33	11 22 33
Zero or more occurrences of AS number 11	11*	Null AS path 11 11 11 11 11 11 11 11
Path of any length that begins with AS numbers 11, 22, 33	11 22 33 .*	11 22 33 11 22 33 400 500 600
Path of any length that ends with AS numbers 44, 55, 66	.* 44 55 66	44 55 66 100 44 55 66 100 200 44 55 66 100 200 300 44 55 66 100 200 300 44 55 66
One occurrence of the AS numbers 100 and 200, followed by one or more occurrences of the number 33	100 200 33+	100 200 33 100 200 33 33 100 200 33 33 33 100 200 33 33 33 33
One or more occurrences of AS number 11, followed by one or more occurrences of AS number 22, followed by one or more occurrences of AS number 33	11+ 22+ 33+	11 22 33 11 11 22 33 11 11 22 22 33 11 11 22 22 33 33 11 11 22 22 3333
Path whose second AS number must be 11 or 22	(. 11) (. 22) .* or . (11 22) .*	100 11 200 22 300 400
Path of length one or two whose second AS number might be 11 or 22	. (11 22)?	100 200 11 300 22

Table 17: AS Path and Community Regular Expression Examples (Continued)

AS Path to Match Criteria	Regular Expression	Example Matches
Path whose first AS number is 100 and second AS number is either 11 or 22	100 (11 22) .*	100 11 100 22 200 300
Either AS path 11, 22, or 33	[11 22 33]	11 22 33
Range of AS numbers to match a single AS number	10-14	10 or 11 or 12 or 13 or 14
	[10-12]*	Null AS path 10 or 11 or 12 10 10 or 10 11 or 10 12 11 10 or 11 11 or 11 12 12 10 or 12 11 or 12 12
Zero or one occurrence of AS number 11	11? or 11{0,1}	Null AS path 11
One through four occurrences of AS number 11	11{1,4}	11 11 11 11 11 11 11 11 11 11
One through four occurrences of AS number 11 followed by one occurrence of AS number 22	11{1,4} 22	11 22 11 11 22 11 11 11 22 11 11 11 11 22
Path of any length, except nonexistent, whose second AS number can be anything, including nonexistent	* or{0,}	100 100 200 11 22 33 44 55
AS number is 100. Community value is 200.	^100:200\$	100:200
AS number is 11 or 22. Community value is any number.	^((11) (22)):(. *)\$	11:100 22:100 11:200
AS number is 11. Community value is any number that starts with 1.	^11:(1.*)\$	11:1 11:100 11:1100

Table 17: AS Path and Community Regular Expression Examples (Continued)

AS Path to Match Criteria	Regular Expression	Example Matches
AS number is any number. Community value is any number that ends with 1, 2, or 3.	^(.*):(.*[1- 3])\$	11:1 100:2002 333:55553
AS number is 11 or 22. Community value is any number that starts with 3 and ends with 4, 5 or 9.	^((11) (22)):(3 .*[459])\$	11:34 22:3335 11:3777779
AS number is 11 or 22. Community value ends in 33 or 44.	[^((11 22)):(.* ((33) (44)))\$	11:33 22:99944 22:555533

a. The null keyword matches an empty AS path.

BGP and OSPF Route Policy Support

OSPF and BGP requires route policy support. Figure 23 and Figure 25 display where route policies are evaluated in the protocol. Figure 23 depicts BGP which applies a route policy as an internal part of the BGP route selection process. Figure 25 depicts OSPF which applies routing policies at the edge of the protocol, to control only the routes that are announced to or accepted from the Route Table Manager (RTM).

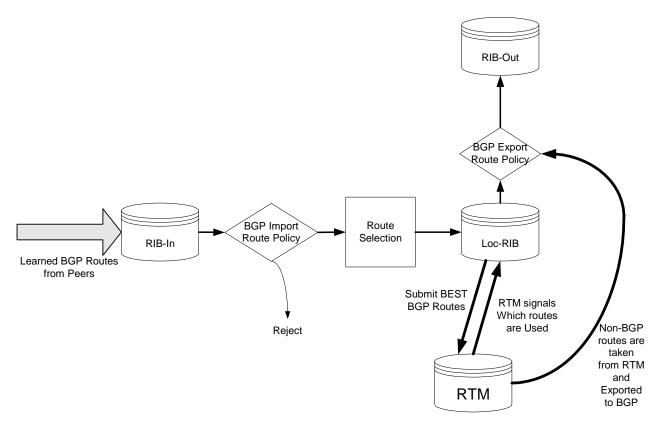

Figure 23: BGP Route Policy Diagram

BGP Route Policies

Alcatel-Lucent's implementation of BGP uses route policies extensively. The implied or default route policies can be overridden by customized route policies. The default BGP properties, with no route policies configured, behave as follows:

• Accept all BGP routes into the RTM for consideration.

- Announce all used BGP learned routes to other BGP peers
- Announce none of the IGP, static or local routes to BGP peers.

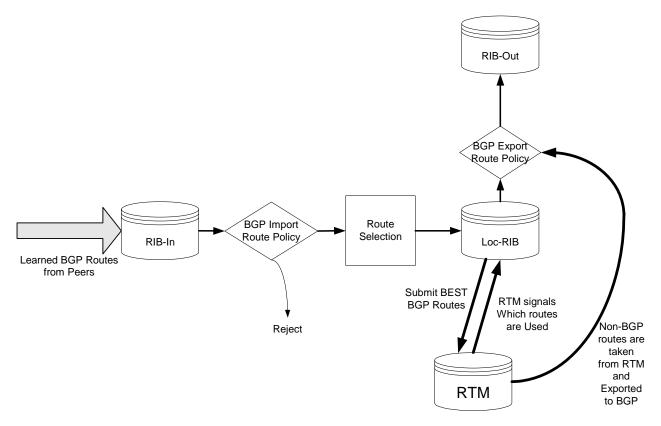

Figure 24: BGP Route Policy Diagram

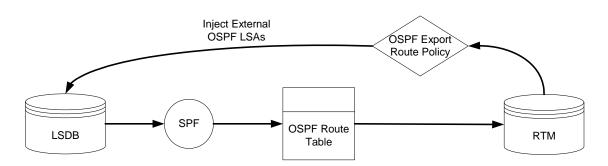

Figure 25: OSPF Route Policy Diagram

Re-advertised Route Policies

Occasionally, BGP routes may be readvertised from BGP into OSPF, IS-IS, and RIP. OSPF export policies (policies control which routes are exported to OSPF) are not handled by the main OSPF task but are handled by a separate task or an RTM task that filters the routes before they are presented to the main OSPF task.

When to Use Route Policies

The following are examples of circumstances of when to configure and apply unique route policies.

- When you want to control the protocol to allow all routes to be imported into the routing table. This enables the routing table to learn about particular routes to enable packet forwarding and redistributing packets into other routing protocols.
- When you want to control the exporting of a protocol's learned active routes.
- When you want a routing protocol to announce active routes learned from another routing protocol, which is sometimes called *route redistribution*.
- When you want unique behaviors to control route characteristics. For example, change the route preference.
- When you want unique behaviors to control route characteristics. For example, change the
 route preference, AS path, or community values to manipulate the control the route
 selection.
- When you want to control BGP route flapping (damping).

Route Policy Configuration Process Overview

Figure 26 displays the process to provision basic route policy parameters.

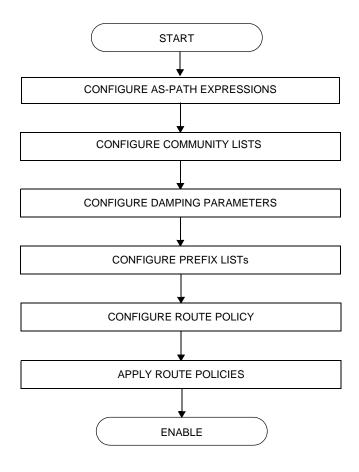

Figure 26: Route Policy Configuration and Implementation Flow

Configuration Notes

This section describes route policy configuration caveats.

General

• When configuring policy statements, the policy statement name must be unique.

Configuration Notes

Configuring Route Policies with CLI

This section provides information to configure route policies using the command line interface.

Route Policy Configuration Overview

Route policies allow you to configure routing according to specifically defined policies. You can create policies and entries to allow or deny paths based on various parameters such as destination address, protocol, packet size, and community list.

Policies can be as simple or complex as required. A simple policy can block routes for a specific location or IP address. More complex policies can be configured using numerous policy statement entries containing matching conditions to specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

When to Create Routing Policies

Route policies are created in the **config>router** context. There are no default route policies. Each route policy must be explicitly created and applied. Applying route policies can introduce more efficiency as well as more complexity to 7750 SR-Series routers' capabilities.

A route policy impacts the flow of routing information or packets within and through the router. A routing policy can be specified to prevent a particular customer's routes to be placed in the route table which causes those routes to not forward traffic to various destinations and the routes are not advertised by the routing protocol to neighbors.

Route policies can be created to control:

- A protocol to export all the active routes learned by that protocol.
- Route characteristics to control which route is selected to act as the active route to reach a destination and advertise the route to neighbors.
- Protocol to import all routes into the routing table. A routing table must learn about particular routes to be able to forward packets and redistribute to other routing protocols.
- Damping.

Before a route policy is applied, analyze the policy's purpose and be aware of the results (and consequences) when packets match the specified criteria and the associated actions and default actions, if specified, are executed. Membership reports can be filtered based on a specific source address.

Default Route Policy Actions

Each routing protocol has default behaviors for the import and export of routing information. Table 18 shows the default behavior for each routing protocol.

Table 18: Default Route Policy Actions

Protocol	Import	Export
OSPF	Not applicable. All OSPF routes are accepted from OSPF neighbors and cannot be controlled via route policies.	 Internal routes: All OSPF routes are automatically advertised to all neighbors. External routes: By default all non-OSPF learned routes are not advertised to OSPF neighbors
IS-IS	Not applicable. All IS-IS routes are accepted from IS-IS neighbors and can not be controlled via route policies	 Internal routes: All IS-IS routes are automatically advertised to all neighbors. External routes: By default all non-IS-IS learned routes are not advertised to IS-IS peers.
RIP	By default, all RIP-learned routes are accepted.	• External routes: By default all non-RIP learned routes are not advertised to RIP peers.
BGP	By default, all routes from BGP peers are accepted and passed to the BGP route selection process.	 Internal routes: By default all active BGP routes are advertised to BGP peers External routes: By default all non-BGP learned routes are not advertised to BGP peers.

Policy Evaluation

Routing policy statements can consist of as few as one or several entries. The entries specify the matching criteria. A route is compared to the first entry in the policy statement. If it matches, the specified entry action is taken, either accepted or rejected. If the action is to accept or reject the route, that action is taken and the evaluation of the route ends.

If the route does not match the first entry, the route is compared to the next entry (if more than one is configured) in the policy statement. If there is a match with the second entry, the specified action is taken. If the action is to accept or reject the route, that action is taken and the evaluation of the route ends, and so on.

Each route policy statement can have a default-action clause defined. If a default-action is defined for one or more of the configured route policies, then the default actions should be handled in the following ways:

- The process stops when the first complete match is found and executes the action defined in the entry.
- If the packet does not match any of the entries, the system executes the default action specified in the policy statement.

Figure 27 depicts an example of the route policy process.

Route policies can also match a given route policy entry and continue to search for other entries within either the same route policy or the next route policy by specifying the *next-entry* or *next-policy* option in the entry's **action** command. Policies can be constructed to support multiple states to the evaluation and setting of various route attributes.

Figure 28 depicts the next-policy and next-entry route processes.

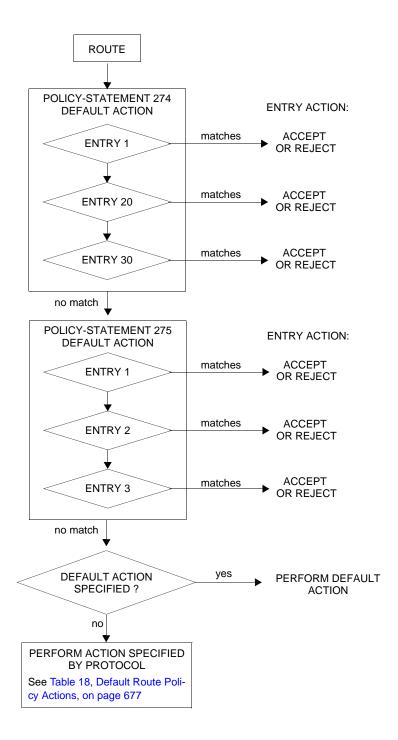

Figure 27: Route Policy Process Example

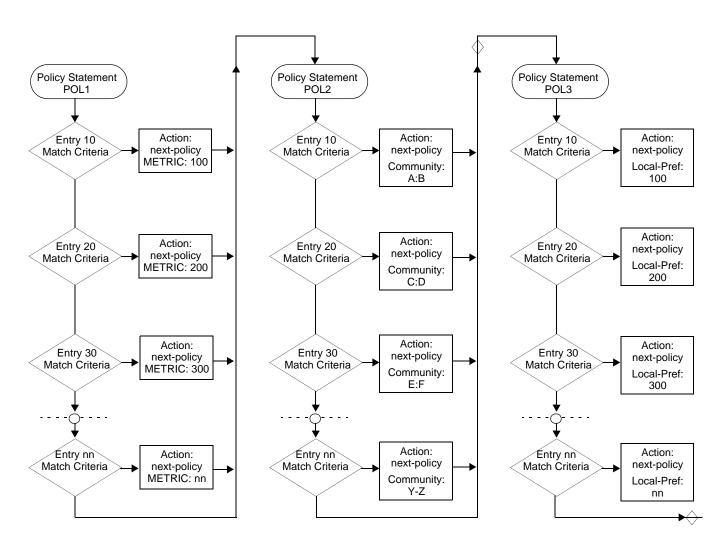

Figure 28: Next Policy Logic Example

Damping

Damping initiates controls when routes flap. Route flapping can occur when an advertised route between nodes alternates (flaps) back and forth between two paths due to network problems which cause intermittent route failures. It is necessary to reduce the amount of routing state change updates propagated in order to limit processing requirements. Thus, when a route flaps beyond a configured value (the suppress value), then that route is removed from the routing tables and routing protocols until the value falls below the reuse value.

A route can be suppressed according to the Figure of Merit (FoM) value. The FoM is a value that is added to a route each time it flaps. A new route begins with an FoM value of 0.

Damping is optional. If damping is configured, the following parameter values must be explicitly specified as there are no default values:

- suppress
- half-life
- reuse
- max-suppress

When a route's FoM value exceeds the suppress value, then the route is removed from the routing table. The route is considered to be stable when the FoM drops below the reuse value by means of the specified half life parameter. The route is returned to the routing tables. When routes have higher FoM and half life values, they are suppressed for longer periods of time. Figure 29 depicts an example of a flapping route, the suppress threshold, the half life decay (time), and reuse threshold. The peaks represent route flaps, the slopes represent half life decay.

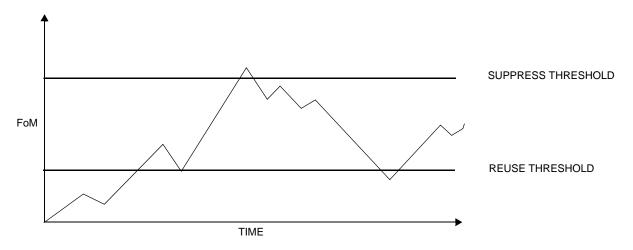

Figure 29: Damping Example

Basic Configurations

This section provides information to configure route policies and configuration examples of common tasks. The minimal route policy parameters that need to be configured are:

- Policy statement with the following parameters specified:
 - \rightarrow At least one entry
 - → Entry action

Following is a sample route policy configuration:

```
A:ALA-B>config>router>policy-options# info
           community "all-types" members "5000:[1-6][1-9][0-9]"
           community "all-normal" members "5000:[1-5][1-9][0-9]"
        as-path "Outside madeup paths" ".* 5001 .*"
           as-path "Outside Internet paths" ".* 5002 .*"
           policy-statement "RejectOutsideASPaths"
               entry 1
                       protocol bgpospf
                       as-path "Outside madeup paths"
                    exit
                    action reject
                    exit
                exit
                entry 2
                       protocol bgpospf
                       as-path "Outside Internet paths"
                    action reject
                   exit
                exit
                entry 3
                   from
                       protocol ospf
                       protocol bgpospf
                    exit
                    action reject
                    exit
                exit
                entry 4
                    from
                       protocol isis
                       protocol bgpospf
                    exit
                    action reject
                    exit
                exit
                default-action accept
                exit
           policy-statement "aggregate-customer-peer-only"
```

Configuring Route Policy Components

Use the CLI syntax displayed below to configure:

- Creating a Route Policy on page 686
- Beginning the Policy Statement on page 685
- Configuring an Entry on page 688
- Configuring a Community List on page 689
- Configuring Damping on page 690
- Configuring a Prefix List on page 691
- Configuring PIM Join/Register Policies on page 692

Beginning the Policy Statement

Use the following CLI syntax to begin a policy statement configuration. In order for a policy statement to be complete an entry must be specified (see Configuring an Entry on page 688).

The following error message displays when the you try to modify a policy options command without entering begin first.

```
A:ALA-B>config>router>policy-options# policy-statement "allow all" MINOR: CLI The policy-options must be in edit mode by calling begin before any changes can be made.
```

The following example displays policy statement configuration command usage. These commands are configured in the config>router context.

```
Example: config>router# policy-options policy-options# begin
```

There are no default policy statement options. All parameters must be explicitly configured.

Creating a Route Policy

To enter the mode to create or edit route policies, you must enter the **begin** keyword at the **config>router>policy-options** prompt. Other editing commands include:

- The **commit** command saves changes made to route policies during a session.
- The abort command discards changes that have been made to route policies during a session.

The following error message displays when the you try to modify a policy options command without entering **begin** first.

```
A:ALA-B>config>router>policy-options# policy-statement "allow all" MINOR: CLI The policy-options must be in edit mode by calling begin before any changes can be made.
```

Configuring a Default Action

Specifying a default action is optional. The default action controls those packets not matching any policy statement entries. If no default action is specified for the policy, then the action associated with the protocol to which the routing policy was applied is performed. The default action is applied only to those routes that do not match any policy entries.

A policy statement must include at least one entry (see Configuring an Entry on page 688).

To enter the mode to create or edit route policies, you must enter the begin keyword at the **config>router>policy-options** prompt. Other editing commands include:

- The **commit** command saves changes made to route policies during a session.
- The **abort** command discards changes that have been made to route policies during a session.

The following example displays the default action configuration:

```
A:ALA-B>config>router>policy-options# info

policy-statement "1"

default-action accept

as-path add "test"

community add "365"

damping "flaptest"

next-hop 10.10.10.10104

exit

exit

A:ALA-B>config>router>policy-options#
```

Configuring an Entry

An entry action must be specified. The other parameters in the **entry action** context are optional. Refer to the Route Policy Command Reference on page 699 for the commands and syntax.

The following example displays entry parameters and includes the default action parameters which were displayed in the previous section.

```
A:ALA-B>config>router>policy-options# info
          policy-statement "1"
              entry 1
                  to
                      protocol bgp
                      neighbor 10.10.10.104
                   action accept
                   exit
               exit
               entry 2
                      protocol ospf 1
                   exit
                     protocol ospf
                      neighbor 10.10.0.91
                   exit
                   action accept
                   exit
               exit
               default-action accept
               exit
           exit
A:ALA-B>config>router>policy-options#
```

Configuring a Community List

Community lists are composed of a group of destinations which share a common property. Community lists allow you to administer actions on a configured group instead of having to execute identical commands for each member.

The following example displays a community list configuration:

```
A:ALA-B>config>router>policy-options# info

community "eastern" members "100:200"
community "western" members "100:300"
community "northern" members "100:500"
community "southern" members "100:500"
community "headquarters" members "100:1000"
policy-statement "1"
entry 1
to
protocol bgp
neighbor 10.10.10.104
exit
action accept
. . . .

A:ALA-B>config>router>policy-options#
```

Configuring Damping

NOTES:

- For each damping profile, all parameters must be configured.
- The suppress value must be greater than the reuse value (see Figure 29 on page 681).
- Damping can be enabled in the config>router>bgp context on the BGP global, group, and neighbor levels. If damping is enabled, but route policy does not specify a damping profile, the default damping profile will be used. This profile is always present and consists of the following parameters:

half-life: 15 minutes
max-suppress: 60 minutes
suppress: 3000
reuse: 750

The following example displays a damping configuration:

```
*A:cses-A13>config>router>policy-options# info
damping "damptest123"
half-life 15
max-suppress 60
reuse 750
suppress 1000
exit
```

*A:cses-A13>config>router>policy-options#

Configuring a Prefix List

The following example displays a prefix list configuration:

Configuring PIM Join/Register Policies

Join policies are used in Protocol Independent Multicast (PIM) configurations to prevent the transportation of multicast traffic across a network and the dropping of packets at a scope at the edge of the network. PIM Join filters reduce the potential for denial of service (DoS) attacks and PIM state explosion—large numbers of Joins forwarded to each router on the RPT, resulting in memory consumption. See Importing PIM Join/Register Policies on page 75.

*,G or S,G is the information used to forward unicast or multicast packets.

- group-address matches the group in join/prune messages group-address 229.55.150.208/32 exact
- source-address matches the source in join/prune messages source-address 192.168.0.0/16 longer
- **interface** matches any join message received on the specified interface interface port 1/1/1
- **neighbor** matches any join message received from the specified neighbor neighbor 1.1.1.1

The following configuration example will not allow join messages for group 229.50.50.208/32 and source 192.168.0.0/16 but allows other join messages.

Configuring policy-statement

```
A:ALA-B>config>router# policy-options
A:ALA-B>config>router>policy-options# begin
A:ALA-B>config>router>policy-options# policy-statement foo
A:ALA-B>config>router>policy-options>policy-statement$ entry 10
A:ALA-B>config>router>policy-options>policy-statement>entry$ from
A:ALA-B>config>router>policy-options>policy-statement>entry>from$ group-address
229.50.50.208/32
A:ALA-B>config>router>policy-options>policy-statement>entry>from$ source-address
192.168.0.0
A:ALA-B>config>router>policy-options>policy-statement>entry>from$ exit
A:ALA-B>config>router>policy-options>policy-statement>entry# action reject
A:ALA-B>config>router>policy-options>policy-statement>entry#
```

The following configuration example allows registers for *, 224,0.0.0/8.

```
A:ALA-B>config>router>policy-options# policy-statement reg-pol
A:ALA-B>config>router>policy-options>policy-statement$ entry 10
A:ALA-B>config>router>policy-options>policy-statement>entry$ from
A:ALA-B>config>router>policy-options>policy-statement>entry>from$ group-address 224.0.0.0/8
A:ALA-B>config>router>policy-options>policy-statement>entry# action accept
A:ALA-B>config>router>policy-options>policy-statement>entry# action# exit
A:ALA-B>config>router>policy-options>policy-statement>entry# exit
A:ALA-B>config>router>policy-options>policy-statement>entry# exit
```

```
A:ALA-B>config>router>policy-options# info
_____
          policy-statement "foo"
             entry 10
                   group-address "229.50.50.208/32"
                   source-address 192.168.0.0
                action reject
          exit
          policy-statement "reg-pol"
             entry 10
                    group-address "224.0.0.0/8"
                exit
                action accept
                exit
             exit
          exit
A:ALA-B>config>router>policy-options#
```

Configuring Bootstrap Message Import and Export Policies

Bootstrap import and export policies are used to control the flow of bootstrap messages to and from the RP.

The following configuration example specifies that no BSR messages received or sent out of interface port 1/1/1.

```
A:ALA-B>config>router>policy-options# policy-statement pim-import
:A:ALA-B>config>router>policy-options>policy-statement$ entry 10
\verb:A:ALA-B> config> router> policy-options> policy-statement> entry \$ from
:A:ALA-B>config>router>policy-options>policy-statement>entry>from$ interface port 1/1/1
:A:ALA-B>config>router>policy-options>policy-statement>entry>from$ exit
:A:ALA-B>config>router>policy-options>policy-statement>entry# action reject
:A:ALA-B>config>router>policy-options>policy-statement>entry# exit
:A:ALA-B>config>router>policy-options>policy-statement# exit
:A:ALA-B>config>router>policy-options# policy-statement pim-export
:A:ALA-B>config>router>policy-options>policy-statement$ entry 10
:A:ALA-B>config>router>policy-options>policy-statement>entry$ to
:A:ALA-B>config>router>policy-options>policy-statement>entry>to$ interface port 1/1/1
:A:ALA-B>config>router>policy-options>policy-statement>entry# action reject
:A:ALA-B>config>router>policy-options>policy-statement>entry# exit
:A:ALA-B>config>router>policy-options>policy-statement# exit
:A:ALA-B>configure router pim rp bootstrap-import pim-import
:A:ALA-B>configure router pim rp bootstrap-export pim-export
```

Route Policy Configuration Management Tasks

This section discusses the following route policy configuration management tasks:

- Editing Policy Statements and Parameters on page 695
- Deleting an Entry on page 697
- Deleting a Policy Statement on page 697

Editing Policy Statements and Parameters

Route policy statements can be edited to modify, add, or delete parameters. To enter the mode to edit route policies, you must enter the begin keyword at the config>router> policy-options prompt. Other editing commands include:

- The **commit** command saves changes made to route policies during a session.
- The **abort** command discards changes that have been made to route policies during a session.

The following example displays a changed configuration:

```
A:ALA-B>config>router>policy-options>policy-statement# info
______
              description "Level 1"
              entry 1
                    protocol bgp
                    neighbor 10.10.10.104
                 exit
                 action accept
                 exit
              exit
              entry 2
                 from
                    protocol ospf
                 exit
                    protocol ospf
                    neighbor 10.10.0.91
                 action accept
                 exit
              exit.
              entry 4
                 description "new entry"
                    protocol isis
                     area 0.0.0.20
                 action reject
```

Route Policy Configuration Management Tasks

```
exit

default-action accept

as-path add "test"

community add "365"

damping "flapper"

next-hop 10.10.10.104

exit
```

Deleting an Entry

Use the following CLI syntax to delete a policy statement entry:

```
CLI Syntax: config>router>policy-options
    begin
    commit
    abort
    policy-statement name
    no entry entry-id
```

The following example displays the commands required to delete a policy statement entry.

```
Example: config>router>policy-options# begin
    policy-options# policy-statement "1"
    policy-options>policy-statement# no entry 4
    policy-options>policy-statement# commit
```

Deleting a Policy Statement

Use the following CLI syntax to delete a policy statement:

```
CLI Syntax: config>router>policy-options
    begin
    commit
    abort
    no policy-statement name
```

The following example displays the commands required to delete a policy statement.

Route Policy Configuration Management Tasks			

Command Hierarchies

- Route Policy Configuration Commands on page 699
- Show Commands on page 702

Route Policy Configuration Commands

```
config
     - [no] router
              — [no] triggered-policy
              — [no] policy-options
                      — begin
                      — commit
                      — abort
                      — as-path (policy options) name {regular-expression | null}
                      — no as-path (policy options) name
                      — community name members comm-id [comm-id ... (up to 15 max)]
                      — no community name [members comm-id]
                      — [no] damping name
                               — half-life minutes
                               — no half-life
                               — max-suppress minutes
                               — no max-suppress
                               — reuse integer
                               — no reuse
                               — suppress integer
                               — no suppress
                      — [no] policy-statement name
                               — default-action {accept | next-entry | next-policy | reject}
                               — no default-action
                                        — as-path {add | replace} name
                                        — no as-path
                                        — as-path-prepend as-number [ repeat]
                                        — no as-path-prepend
                                        — community {{add name [remove name]} | {remove name [add
                                           name]} | {replace name}}
                                        — no community
                                        — damping {name | none}
                                        — no damping

    local-preference local-preference

                                        — no local-preference
                                        — metric {add | subtract | set} metric
                                        — no metric
                                        — next-hop ip-address
                                        — no next-hop
                                        — [no] next-hop-self
```

Generic Commands

abort

Syntax abort

Context config>router>policy-options

This command is required to discard changes made to a route policy.

Default none

begin

Syntax begin

Context config>router>policy-options

Description This command is required in order to enter the mode to create or edit route policies.

Default none

commit

Syntax commit

Context config>router>policy-options

Description This command is required to save changes made to a route policy.

Default none

description

Syntax description string

no description

Context config>router>policy-options>policy-statement

config>router>policy-options>policy-statement>entry

Description This command creates a text description which is stored in the configuration file to help identify the content

of the entity.

The **no** form of the command removes the string from the configuration.

Default none

Parameters string — The description character string. Allowed values are any string up to 80 characters long composed

of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the

entire string must be enclosed within double quotes.

Route Policy Options

as-path (policy options)

Syntax as-path name {reg-exp | null}

no as-path name

Context config>router>policy-options

Description This command creates a route policy AS path regular expression statement to use in route policy entries.

The no form of the command deletes the AS path regular expression statement.

Default No AS path regular expression statement is defined.

Parameters name — The AS path regular expression name. Allowed values are any string up to 32 characters long com-

posed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.),

the entire string must be enclosed within double quotes.

reg-exp — The AS path regular expression. Allowed values are any string up to 256 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.),

the entire string must be enclosed within double quotes.

null — The AS path expressed as an empty regular expression string.

community

Syntax community name members comm-id [comm-id...up to 15 max]

no community name [members comm-id]

Context config>router>policy-options

Description This command creates a route policy community list to use in route policy entries.

The **no** form of the command deletes the community list or the provided community ID.

Default no community — No community names or members are specified.

Parameters name — The community list name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire

string must be enclosed within double quotes.

 $\mathit{comm\text{-}id}$ — The community ID. Note that up to 15 community ID strings can be specified up to a total max-

imum of 72 characters.

Values 72 chars max

2byte-asnumber:comm-val | reg-ex | ext-comm | well-known-comm

ext-comm type:{ip-address:comm-val | reg-ex1®-ex2 | ip-address®-

ex2 | 2byte-asnumber:ext-comm-val |4byte-asnumber:comm-val}

2byte-asnumber 0..65535

comm-val 0..65535 reg-ex 72 chars max type target, origin ip-address a.b.c.d

ext-comm-val 0..4294967295 4byte-asnumber 0..4294967295 reg-ex1 63 chars max reg-ex2 63 chars max

well-known-comm null, no-export,no-export-subconfed, no-advertise

A community ID can be specified in different forms:

• as-num:comm.-value — The as-num is the Autonomous System Number (ASN)

Values as-num: 1 — 65535

comm-value: 0 — 65535

- type {target | origin} : as-num:comm.-value The keywords target or origin denote the community as an extended community of type route target or route origin respectively. The as-num and comm.-value allow the same values as described above for regular community values.
- reg-ex1 reg-ex2— A regular expression string. Allowed values are any string up to 63 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.
- well-known-comm keywords null, no-export, no-export-subconfed, no-advertise

policy-options

Syntax [no] policy-options

Context config>router

Description This command enables the context to configure route policies. Route policies are applied to the routing pro-

tocol.

The **no** form of the command deletes the route policy configuration.

Default none

triggered-policy

Syntax [no] triggered-policy

Context config>router

Description This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would effect every BGP peer on a SR-

Series router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the *soft* or *soft-inbound* option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

Default

Non-dynamic route policy is disabled.

Route Policy Damping Commands

damping

Syntax [no] damping name

Context config>router>policy-options

Description This command creates a context to configure a route damping profile to use in route policy entries.

The **no** form of the command deletes the named route damping profile.

Default No damping profiles are defined.

Parameters name — The damping profile name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire

string must be enclosed within double quotes.

half-life

Syntax half-life minutes

no half-life

Context config>router>policy-options>damping

Description This command configures the **half-life** parameter for the route damping profile.

The half life value is the time, expressed in minutes, required for a route to remain stable in order for the Figure of Merit (FoM) value to be reduced by one half; for example, if the half life value is 6 (minutes) and the route remains stable for 6 minutes, then the new FoM value is 3 (minutes). After another 3 minutes pass and

the route remains stable, the new FoM value is 1.5 (minutes).

When the FoM value falls below the **reuse** threshold, the route is once again considered valid and can be

reused or included in route advertisements.

The **no** form of the command removes the half life parameter from the damping profile.

Default No half life value is specified. The half life value must be explicitly configured.

Parameters *minutes* — The half life in minutes expressed as a decimal integer.

Values 1 — 45

max-suppress

Syntax max-suppress minutes

no max-suppress

Context config>router>policy-options>damping

Description This command configures the maximum suppression parameter for the route damping profile.

This value indicates the maximum time, expressed in minutes, that a route can remain suppressed.

The **no** form of the command removes the maximum suppression parameter from the damping profile.

Default No maximum suppression time is configured.

Parameters minutes — The maximum suppression time, in minutes, expressed as a decimal integer.

Values 1 — 720

reuse

Syntax reuse integer

no reuse

Context config>router>policy-options>damping

Description This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the reuse threshold, the route is once again considered

valid and can be reused or included in route advertisements.

The **no** form of the command removes the reuse parameter from the damping profile.

Default No reuse parameter is configured.

Parameters *integer* — The reuse value expressed as a decimal integer.

Values 1 — 20000

suppress

Syntax suppress integer

no suppress

Context config>router>policy-options>damping

Description This command configures the suppression parameter for the route policy damping profile.

A route is suppressed when it has flapped frequently enough to increase the Figure of Merit (FoM) value to exceed the **suppress** threshold limit. When the **FoM** value exceeds the **suppress** threshold limit, the route is

removed from the route table or inclusion in advertisements.

The **no** form of the command removes the suppress parameter from the damping profile.

Default No suppress parameter is configured.

Parameters integer — The suppress value expressed as a decimal integer.

Values 1 — 20000

Route Policy Prefix Commands

prefix-list

Syntax [no] prefix-list name

Context config>router>policy-options

Description This command creates a context to configure a prefix list to use in route policy entries.

The **no** form of the command deletes the named prefix list.

Default none

Parameters name — The prefix list name. Allowed values are any string up to 32 characters long composed of printable,

7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must

be enclosed within double quotes.

prefix

Syntax [no] prefix ip-prefix/prefix-length { [exact | longer | through | length]/ [prefix-length-range

length1-length2]}

no prefix [ipv-prefix/prefix-length] [exact | longer | through | prefix-length-range | length1-

length2]

Context config>router>policy-options>prefix-list

Description This command creates a prefix entry in the route policy prefix list.

The no form of the command deletes the prefix entry from the prefix list.

Parameters *ip-prefix* — The IP prefix for prefix list entry in dotted decimal notation.

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-length: 0 - 32

ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

ipv6-prefix-length: 0 - 128

exact — Specifies the prefix list entry only matches the route with the specified *ip-prefix* and prefix *mask* (length) values.

longer — Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values greater than the specified *mask*.

through *length* — Specifies the prefix list entry matches any route that matches the specified ip-prefix and has a prefix length between the specified *length* values inclusive.

Values
$$0 - 32$$

prefix-length-range *length1* - *length2* — Specifies a route must match the most significant bits and have a prefix length with the given range. The range is inclusive of start and end values.

Values
$$0 - 32$$
, $length2 > length1$

Route Policy Entry Match Commands

entry

Syntax entry entry-id

no entry

Context config>router>policy-options>policy-statement

Description This command creates the context to edit route policy entries within the route policy statement.

Multiple entries can be created using unique entries. The 7750 SR OS exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to

least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must have at least define an action in order to be considered complete. Entries without an action are considered incom-

plete and will be rendered inactive.

The **no** form of the command removes the specified entry from the route policy statement.

Default none

Parameters entry-id — The entry ID expressed as a decimal integer. An entry-id uniquely identifies match criteria and

the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all

the existing entries.

Values 1 — 4294967295

area

Syntax area area-id

no area

Context config>router>policy-options>policy-statement>entry>from

Description This command configures an OSPF area as a route policy match criterion.

This match criterion is only used in export policies.

All OSPF routes (internal and external) are matched using this criterion if the best path for the route is by the

specified area.

The **no** form of the command removes the OSPF area match criterion.

Default none

Parameters area-id — The OSPF area ID expressed in dotted decimal notation or as a 32-bit decimal integer.

Values 0.0.0.0 — 255.255.255.255 (dotted decimal), 0 — 4294967295 (decimal)

as-path

Syntax as-path name

no as-path

Context config>router>policy-options>policy-statement>entry>from

Description This command configures an AS path regular expression statement as a match criterion for the route policy

entry.

If no AS path criterion is specified, any AS path is considered to match.

AS path regular expression statements are configured at the global route policy level (config>router>pol-

icy-options>as-path name).

The **no** form of the command removes the AS path regular expression statement as a match criterion.

Default no as-path — Matches any AS path.

Parameters name — Specifies an existing name. The AS path regular expression name. Allowed values are any string up

to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special

characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

community

Syntax community name

no community

Context config>router>policy-options>policy-statement>entry>from

Description This command configures a community list as a match criterion for the route policy entry.

If no community list is specified, any community is considered a match.

The **no** form of the command removes the community list match criterion.

Default no community — Matches any community.

Parameters name — The community list name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire

string must be enclosed within double quotes.

The *name* specified must already be defined.

from

Syntax [no] from

Context config>router>policy-options>policy-statement>entry

Description This command creates the context to configure policy match criteria based on a route's source or the protocol

from which the route is received.

If no condition is specified, all route sources are considered to match.

The **no** form of the command deletes the source match criteria for the route policy statement entry.

external

Syntax [no] external

Context config>router>policy-options>policy-statement>entry>from

Description This command specifies the external route matching criteria for the entry.

Default no external

family

Syntax family [ipv4] [ipv6] [mcast-ipv4] [mcast-ipv6] [vpn-ipv4] [vpn-ipv6] [l2-vpn] [mvpn-ipv4]

no family

Context config>router>policy-options>policy-statement>entry>from

Description This command specifies address families as matching conditions.

Parameters ipv4 — Specifies IPv4 routing information.

ipv6 — Specifies IPv6 routing information.

mcast-ipv4 — Specifies multicast IPv4 routing information.

mcast-ipv6 — Specifies multicast IPv6 routing information.

vpn-ipv4 — Specifies IPv4 VPN routing information.

12-vpn — Exchanges Layer 2 VPN information.

mvpn-ipv4 — Exchanges Multicast VPN related information

group-address

Syntax group-address prefix-list-name

no group-address

Context config>router>policy-options>policy-statement>entry>from

Description This command specifies the multicast group-address prefix list containing multicast group-addresses that are

imbedded in the join or prune packet as a filter criterion. The prefix list must be configured prior to entering this command. Prefix lists are configured in the **config>router>policy-options>prefix-list** context.

The **no** form of the command removes the criterion from the configuration.

Default no group-address

Parameters

prefix-list-name — The prefix-list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

The *prefix-list-name* is defined in the **config>router>policy-options>prefix-list** context.

host-ip

Syntax host-ip prefix-list-name

Context config>router>policy-options>policy-statement>entry>from

Description This command specifies a prefix list host IP address as a match criterion for the route policy-statement entry.

Default no host-ip

Parameters prefix-list-name — The prefix-list name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire

string must be enclosed within double quotes.

The *prefix-list-name* is defined in the **config>router>policy-options>prefix-list** context.

interface

Syntax interface interface-name

no interface

Context config>router>policy-options>policy-statement>entry>from

Description This command specifies the router interface, specified either by name or address, as a filter criterion.

The **no** form of the command removes the criterion from the configuration.

Default no interface

Parameters ip-int-name — Specify the name of the interface as a match criterion for this entry. If the string contains

special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

level

Syntax level {1 | 2}

no level

Context config>router>policy-options>policy-statement>entry>from

config>router>policy-options>policy-statement>entry>to

Description This command specifies the ISIS route level as a match criterion for the entry.

Default no level

Parameters 1 | 2 — Matches the IS-IS route learned from level 1 or level 2.

neighbor

Syntax neighbor {ip-address | prefix-list name}

no neighbor

Context config>router>policy-options>policy-statement>entry>to

config>router>policy-options>policy-statement>entry>from

Description This command specifies the neighbor address as found in the source address of the actual join and prune

message as a filter criterion. If no neighbor is specified, any neighbor is considered a match.

The **no** form of the of the command removes the neighbor IP match criterion from the configuration.

Default no neighbor — Matches any neighbor.

Parameters *ip-addr* — The neighbor IP address in dotted decimal notation.

Values ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x:[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 — FFFF]H d: [0 — 255]D

interface (32 chars max, mandatory for link local addresses)

prefix-list *name* — The prefix-list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

The name specified must already be defined.

origi

Syntax origin {igp | egp | incomplete | any}

no origin

Context config>router>policy-options>policy-statement>entry>from

Description This command configures a BGP origin attribute as a match criterion for a route policy statement entry.

If no origin attribute is specified, any BGP origin attribute is considered a match.

The **no** form of the command removes the BGP origin attribute match criterion.

Default no origin — Matches any BGP origin attribute

Parameters igp — Configures matching path information originating within the local AS.

egp — Configures matching path information originating in another AS.

incomplete — Configures matching path information learned by another method.

any — Specifies to ignore this criteria.

policy-statement

Syntax [no] policy-statement name

Context config>router>policy-options

Description This command creates the context to configure a route policy statement.

Route policy statements control the flow of routing information to and from a specific protocol, set of proto-

cols, or to a specific BGP neighbor.

The **policy-statement** is a logical grouping of match and action criteria. A single **policy-statement** can affect routing in one or more protocols and/or one or more protocols peers/neighbors. A single **policy-state-**

ment can also affect both the import and export of routing information.

The **no** form of the command deletes the policy statement.

Default no policy-statement — No route policy statements are defined.

Parameters name — The route policy statement name. Allowed values are any string up to 32 characters long composed

of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the

entire string must be enclosed within double quotes.

prefix-list

Syntax prefix-list name [name...up to 5 max]

no prefix-list

Context config>router>policy-options>policy-statement>entry>from

config>router>policy-options>policy-statement>entry>to

Description This command configures a prefix list as a match criterion for a route policy statement entry.

If no prefix list is specified, any network prefix is considered a match.

The prefix lists specify the network prefix (this includes the prefix and length) a specific policy entry

applies.

A maximum of five prefix names can be specified.

The **no** form of the command removes the prefix list match criterion.

Default no prefix-list — Matches any network prefix.

Parameters name — The prefix list name. Allowed values are any string up to 32 characters long composed of printable,

7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must

be enclosed within double quotes.

protocol

Syntax protocol {protocol} [all | instance instance]

no protocol

Context config>router>policy-options>policy-statement>entry>from

config>router>policy-options>policy-statement>entry>to

Description This command configures a routing protocol as a match criterion for a route policy statement entry. This

command is used for both import and export policies depending how it is used.

If no protocol criterion is specified, any protocol is considered a match.

The **no** form of the command removes the protocol match criterion.

Default no protocol — Matches any protocol.

Parameters protocol — The protocol name to match on.

Values bgp, direct, ospf, rip, isis, static, aggregate, bgp-vpn, igmp, pim, ospfv3, ldp

instance — The OSPF or IS-IS instance.

Values 1 — 31

all — OSPF- or ISIS-only keyword.

source-address

Syntax source-address ip-address

no source-address

Context config>router>policy-options>policy-statement>entry>from

Description This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of the command removes the criterion from the configuration.

Default none

Description This command specifies a multicast data source address as a match criterion for this entry.

Parameters ip-address — The IP prefix for the IP match criterion in dotted decimal notation.

tag

Syntax tag tag

no tag

Context config>router>policy-options>policy-statement>entry>from

Description This command adds an integer tag to the static route. These tags are then matched on to control route redis-

tribution.

The **no** form of the command removes the tag field match criterion.

Default no tag — Matches any external LSA tag field.

Parameters tag — Matches a specific external LSA tag field.

Values no-tag, 1 — 4294967295

to

Syntax [no] to

Context config>router>policy-options>policy-statement>entry

Description This command creates the context to configure export policy match criteria based on a route's destination or

the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The to command context only applies to export policies. If it is used for an import policy, match criteria is

ignored.

The **no** form of the command deletes export match criteria for the route policy statement entry.

type

Syntax type {1 | 2}

no type

Context config>router>policy-options>policy-statement>entry>from

Description This command configures an OSPF type metric as a match criterion in the route policy statement entry.

If no type is specified, any OSPF type is considered a match.

The **no** form of the command removes the OSPF type match criterion.

Parameters 1 — Matches OSPF routes with type 1 LSAs.

2 — Matches OSPF routes with type 2 LSAs.

Route Policy Action Commands

action

Syntax action {accept | next-entry | next-policy | reject}

no action

Context config>router>policy-options>policy-statement>entry

Description This command creates the context to configure actions to take for routes matching a route policy statement

entry.

This command is required and must be entered for the entry to be active.

Any route policy entry without the action command will be considered incomplete and will be inactive.

The **no** form of the command deletes the action context from the entry.

Default no action — No action is defined.

Parameters accept — Specifies routes matching the entry match criteria will be accepted and propagated.

next-entry — Specifies that the actions specified would be made to the route attributes and then policy evaluation would continue with next policy entry (if any others are specified).

next-policy — Specifies that the actions specified would be made to the route attributesand then policy eval-

reject — Specifies routes matching the entry match criteria would be rejected.

uation would continue with next route policy (if any others are specified).

as-path

Syntax as-path {add | replace} name

no as-path

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry>action

Description This command assigns a BGP AS path list to routes matching the route policy statement entry.

If no AS path list is specified, the AS path attribute is not changed.

The **no** form of the command disables the AS path list editing action from the route policy entry.

Default no as-path — The AS path attribute is not changed.

Parameters add — Specifies that the AS path list is to be prepended to an existing AS list.

replace — Specifies AS path list replaces any existing as path attribute.

Route Policy Command Reference

name — The AS path list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

The *name* specified must already be defined.

as-path-prepend

Syntax as-path-prepend as-num [repeat]

no as-path-prepend

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry>action

Description The command prepends a BGP AS number once or numerous times to the AS path attribute of routes match-

ing the route policy statement entry.

If an AS number is not configured, the AS path is not changed.

If the optional *number* is specified, then the AS number is prepended as many times as indicated by the num-

ber.

The **no** form of the command disables the AS path prepend action from the route policy entry.

Default no as-path-prepend — no AS number prepending configured.

Parameters as-num — The AS number to prepend expressed as a decimal integer.

Values 1 — 4294967295

repeat — The number of times to prepend the specified AS number expressed as a decimal integer.

Values 1 — 50

community

Syntax community {{add name [remove name]} | {remove name [add name]} | {replace name}}

no community

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry>action

Description This command adds or removes a BGP community list to or from routes matching the route policy statement

entry.

If no community list is specified, the community path attribute is not changed.

The community list changes the community path attribute according to the **add** and **remove** keywords.

The no form of the command disables the action to edit the community path attribute for the route policy

entry.

Default no community — The community path attribute is not changed.

Parameters

add — The specified community list is added to any existing list of communities.

remove — The specified community list is removed from the existing list of communities.

replace — The specified community list replaces any existing community attribute.

name — The community list name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

damping

Syntax damping {name | none}

no damping

Context config>router>policy-options>policy-statement >default-action

config>router>policy-options>policy-statement>entry>action

Description This command configures a damping profile used for routes matching the route policy statement entry.

If no damping criteria is specified, the default damping profile is used.

The **no** form of the command removes the damping profile associated with the route policy entry.

Default no damping — Use the default damping profile.

Parameters name — The damping profile name. Allowed values are any string up to 32 characters long composed of

printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire

string must be enclosed within double quotes.

The *name* specified must already be defined.

none — Disables route damping for the route policy.

default-action

Syntax default-action {accept | next-entry | next-policy | reject}

no default-action

Context config>router>policy-options>policy-statement

Description This command enables the context to configure actions for routes that do not match any route policy statement entries when the **accent** parameter is specified.

ment entries when the **accept** parameter is specified.

The default action clause can be set to all available action states including: accept, reject, next-entry and next-policy. If the action states accept or reject then the policy evaluation terminates and the appropriate

result is returned.

If a default action is defined and no match(es) occurred with the entries in the policy then the default action

clause is used.

If a default action is defined and one or more matches occurred with the entries of the policy then the default

action is not used.

Route Policy Command Reference

The no form of the command deletes the default-action context for the policy statement.

Default no default-action — No default action is specified.

Parameters accept — Specifies routes matching the entry match criteria will be accepted and propagated.

next-entry — Specifies that the actions specified would be made to the route attributes and then policy evaluation would continue with next policy entry (if any others are energified)

uation would continue with next policy entry (if any others are specified).

next-policy — Specifies that the actions specified would be made to the route attributes and then policy evaluation would continue with next route policy (if any others are specified).

reject — Specifies routes matching the entry match criteria would be rejected.a

local-preference

Syntax local-preference preference

no local-preference

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry

Description This command assigns a BGP local preference to routes matching a route policy statement entry.

If no local preference is specified, the BGP configured local preference is used.

The **no** form of the command disables assigning a local preference in the route policy entry.

Default No local-preference — BGP default preference is assigned.

Parameters preference — The local preference expressed as a decimal integer.

Values 0 — 4294967295

metric

Syntax metric {add | subtract | set} metric

no metric

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry>action

Description This command assigns a metric to routes matching the policy statement entry.

If no metric is specified, the configured metric is used. If neither is defined, no metric will be advertised.

The value assigned for the metric by the route policy is controlled by the required keywords.

The **no** form of the command disables assigning a metric in the route policy entry.

Default no metric — Uses the configured metric (if defined) or do not advertise a metric.

Parameters add — Specified *integer* is added to any existing metric. If the result of the addition results in a number

greater than 4294967295, the value 4294967295 is used.

subtract — Specified *integer* is subtracted from any existing metric. If the result of the subtraction results in a number less than 0, the value of 0 is used.

set — Specified *integer* replaces any existing metric.

metric — The metric modifier expressed as a decimal integer.

Values 0 — 4294967295

next-hop

Syntax next-hop ip-address

no next-hop

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry>action

Description This command assigns the specified next hop IP address to routes matching the policy statement entry.

If a next-hop IP address is not specified, the next-hop attribute is not changed.

The **no** form of the command disables assigning a next hop address in the route policy entry.

Default no next-hop — The next hop attribute is not changed.

Parameters *ip-address* — The next hop IP address in dotted decimal notation.

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-length: 0 - 32

ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d x: [0 — FFFF]H d: [0 — 255]D

next-hop-self

Syntax [no] next-hop-self

Context config>router>policy-options>policy-statement *name*>default-action

config>router>policy-options>policy-statement>entry>action

Description This command advertises a next hop IP address belonging to this router even if a third-party next hop is

available to routes matching the policy statement entry.

The **no** form of the command disables advertising the next-hop-self option for the route policy entry.

Default no next-hop-self — The next hop IP address is not changed.

next-hop-self

Syntax [no] next-hop-self [multihoming primary-anycast secondary-anycast]

Context config>router>policy-option>policy-statement>entry>action

Description This command configures the group or neighbor to always set the NEXTHOP path attribute to its own

physical interface when advertising to a peer. This is primarily used to avoid third-party route advertisements

when connected to a multi-access network.

In addition, this command can be used to enable and configure the multi-homing reliency mechanism

replacing the usual BGP nexthop with a configured anycast address.

The no form of the command returns the setting of the BGP next-hop attribute to the default value

determined by the BGP protocol.

Default no next-hop-self

Parameters *primary-anycast* — Specifies the anycast address that the local node will use to replace the BGP nexthop

address in route updates associated peers.

secondary-address — Specifies the anycast address that the local node is to track.

origin

Syntax origin {igp | egp | incomplete}

no origin

Context config>router>policy-options>policy-statement *name*>default-action

config>router>policy-options>policy-statement>entry>action

Description This command sets the BGP origin assigned to routes exported into BGP.

If the routes are exported into protocols other than BGP, this option is ignored.

The **no** form of the command disables setting the BGP origin for the route policy entry.

Default no origin

Parameters igp — Sets the path information as originating within the local AS.

egp — Sets the path information as originating in another AS.

incomplete — Sets the path information as learned by some other means.

preference

Syntax preference preference

no preference

Context config>router>policy-options>policy-statement *name*>default-action

config>router>policy-options>policy-statement>entry>action>action

Description This command assigns a route preference to routes matching the route policy statement entry.

If no preference is specified, the default Route Table Manager (RTM) preference for the protocol is used.

The **no** form of the command disables setting an RTM preference in the route policy entry.

Default no preference — No route preference is assigned by the policy entry. The protocol default preference is

used.

Parameters preference — The route preference expressed as a decimal integer.

Values 1 — 255 (0 represents unset - MIB only)

tag

Syntax tag tag

no tag

Context config>router>policy-options>policy-statement>default-action

config>router>policy-options>policy-statement>entry>action

Description This command assigns an OSPF tag to routes matching the entry. The tag value is used to apply a tag to a

route for either an OSPF or RIP route. A hexadecimal value of 4 octets can be entered.

For OSPF, all four octets can be used.

For RIP, only the two most significant octets are used if more than two octets are configured.

The **no** form of the command removes the tag.

Default no tag

Parameters tag — Assigns an OSPF, RIP or ISIS tag to routes matching the entry.

Values Accepts decimal or hex formats:

OSPF and ISIS: [0x0..0xFFFFFFF]H RIP: [0x0..0xFFFF]H

Route Policy Command Reference

type

Syntax type {type}

no type

Context config>router>policy-options>policy-statement *name*>default-action

config>router>policy-options>policy-statement>entry>action

Description This command assigns an OSPF type metric to routes matching the route policy statement entry and being

exported into OSPF.

The **no** form of the command disables assigning an OSPF type in the route policy entry.

Default no type

Parameters *type* — Specifies the OSPF type metric.

Values 1 — Set as OSPF routes with type 1 LSAs

2 — Set as OSPF routes with type 2 LSAs.

Show Commands

policy

Syntax policy [name | damping | prefix-list name |as-path name |community name | admin]

Context show>router

Description This command displays configured policy statement information.

Parameters policy name — Displays information similar to the info command for a specific policy-statement. If a name

is provided, the matching policy-statement displays.

If no statement name is specified, a list of all policies statements and descriptions display.

damping — Displays the damping profile for use in the route policy.

prefix-list name — Displays the prefix lists configured in the route policy.

as-path — Displays AS path regular expression statements used in the route policy.

community — Displays community lists used in the route policy.

admin — If the keyword **admin** is included, the entire policy option configuration displays, including any un-committed configuration changes. This command is similar to the **info** command.

Output Route Policy Output — The following table describes route policy output fields.

Label	Description
Policy	Displays a list of route policy names.
Description	Displays the description of each route policy.
Policies	The total number of policies configured.
Damping	Displays the damping profile name.
half-life	Displays the half-life parameter for the route damping profile.
max-suppress	Displays the maximum suppression parameter configured for the route damping profile.
Prefix List	Displays the prefix list name and IP address/mask and whether the prefix list entry only matches (exact) the route with the specified <i>ip-prefix</i> and prefix <i>mask</i> (length) values or values greater (longer) than the specified <i>mask</i> .
AS Path Name	Displays a list of AS path names.
AS Paths	Displays the total number of AS paths configured.
Community Name	Displays a list of community names.
Communities	Displays the total number of communities configured.

The following route policy commands are displayed with different command parameter options:

- show router policy on page 730
- show router policy admin on page 730
- show router policy "BGP To RIP" on page 732
- show router policy damping on page 732
- show router policy prefix-list on page 733
- show router policy prefix-list All-Routes on page 733
- show router policy as-path on page 733
- show router policy as-path test on page 733
- show router policy community on page 734
- show router policy community 65206 on page 734

Sample Output

The show router policy command displays all configured route policies.

The **show router policy admin** command is similar to the **info** command which displays information about the route policies and parameters.

```
A:ALA-1# show router policy admin
    prefix-list "All-Routes"
            prefix 0.0.0.0/0 longer

RFC 1990 The PPP Multilink Protocol (MP)

RFC 1994 PPP Challenge Handshake Authentication Protocol (CHAP)

RFC 2516 A Method for Transmitting PPP Over EthernetRFC 2615 PPP over SONET/SDH

RFC 2686 The Multi-Class Extension to Multi-Link PPP

Frame Relay

FRF.1.2 - PVC User-to-Network Interface (UNI) Implementation Agreement

FRF.5 - Frame Relay/ATM PVC Network Interworking Implementation

ANSI T1.617 Annex D, DSS1 — Signalling Specification For Frame Relay Bearer Service.

FRF2.2 -PVC Network-to- Network Interface (NNI) Implementation Agreement.

FRF.12 Frame Relay Fragmentation Implementation Agreement

FRF.16.1 Multilink Frame Relay UNI/ NNI Implementation Agreement

ITU-T Q.933 Annex A-Additional procedures for Permanent Virtual Connection (PVC) status management

ATM

RFC 1626 Default IP MTU for use over ATM AAL5

RFC 2514 Definitions of Textual Conventions and OBJECT_IDENTITIES for ATM Management

RFC 2515 Definition of Managed Objects for ATM Management RFC 2684 Multiprotocol Encapsulation over ATM Adaptation Layer 5

AF-TM-0121.000 Traffic Management Specification Version 4.1

ITU-T Recommendation I.610 - B-ISDN Operation and Maintenance Principles and Functions version 11/ 95

ITU-T Recommendation I.432.1 — BISDN user-network interface —

Physical layer specification: General characteristics

GR-1248-CORE - Generic Requirements for Operations of ATM Network Elements (NEs). Issue 3

GR-1113-CORE - Bellcore, Asynchronous Transfer Mode (ATM) and ATM Adaptation Layer (AAL) Protocols Generic Requirements, Issue 1

AF-ILMI-0065.000 Integrated Local Management Interface (ILMI) Version 4.0

AF-TM-0150.00 Addendum to Traffic Management v4.1 optional minimum desired cell rate indication for UBR

AF-PHY-0086.001, Inverse Multiplexing for ATM (IMA) Specification Version 1.1

DHCP

RFC 2131 Dynamic Host Configuration Protocol (REV)

RFC 3046 DHCP Relay Agent Information Option (Option 82)

RFC 1534 Interoperation between DHCP and BOOTP

VPLS

RFC 4762 Virtual Private LAN Services Using LDP

draft-ietf-l2vpn-vpls-mcast-reqts-04 draft-ietf-l2vpn-signaling-08

PSEUDO-WIRE

RFC 3985 Pseudo Wire Emulation Edgeto-Edge (PWE3)

RFC 4385 Pseudo Wire Emulation Edgeto-Edge (PWE3) Control Word for Use over an MPLS PSN

RFC 3916 Requirements for Pseudo-Wire Emulation Edge-to-Edge (PWE3)

RFC 4717 Encapsulation Methods for Transport ATM over MPLS Networks (draft-ietf-pwe3-atmencap-10.txt)

RFC 4816 PWE3 ATM Transparent Cell Transport Service (draft-ietf-pwe3cell-transport-04.txt)

RFC 4448 Encapsulation Methods for Transport of Ethernet over MPLS

Standards and Protocols

- Networks (draft-ietf-pwe3-ethernet-encap-11.txt)
- RFC 4619 Encapsulation Methods for Transport of Frame Relay over MPLS Networks (draft-ietf-pwe3frame-relay-07.txt)
- RFC 4446 IANA Allocations for PWE3
- RFC 4447 Pseudowire Setup and Maintenance Using LDP (draft-ietfpwe3-control-protocol-17.txt)
- RFC 5085, Pseudowire Virtual Circuit Connectivity Verification (VCCV):A Control Channel for Pseudowires
